PREFACE.

IN presenting to the world its first Phonetic Dictionary, the Compiler feels confident that the simple, but appropriate dress, with which he has clothed the spoken language, cannot fail to commend itself to the favorable consideration of every friend of human progress. Owing to the inherent defects of our common orthography, lexicographers have been compelled to employ a notation more or less complicated and indefinite, which has made the study of pronunciation, by means of dictionaries, distasteful and unsatisfactory. All diacritic marks are more or less objectionable on account of their obscurity and necessary multiplicity, resulting from the use of different letters marked to represent the same sound.

The object of the present work is to correctly represent, by means of a Phonetic alphabet, that pronunciation of the English language which is supported by the greatest number of competent authorities, and to define and explain the words, as they are generally employed by standard writers. The common alphabet being defective, in not having a sufficient number of letters to represent accurately the pronunciation of the language, new ones have been added to make up the deficiency, harmonizing in form and proportion with the old letters. Each letter represents but one sound, consequently its power is always known when it has once been learned, and no doubt or difficulty will be experienced in spelling or pronouncing the words of the English language written in this new orthography.

Much attention has been given to *pronunciation*; and the most reliable authorities have been consulted. The Compiler has received valuable information from the writings of Walker, Webster, Worcester, B. H. Smart, and Alexander Melville Bell, all of whom are well known for their critical knowledge of orthoepy. With respect to words variously pronounced, that pronunciation is placed first which is supported by the greatest number of competent authorities.

An attempt has been made to correctly represent the obscure vowels in unaccented syllables, the quality of which is not indicated in the dictionaries

of Webster and Worcester. Walker very justly remarked: "If we cannot point out the precise sound of unaccented syllables, we may at least give those sounds which approach the nearest, and by this means become a little more useful than those who so liberally leave every thing to the ear and taste of the speaker." The perfect distinction of minutely differing vowels is no less a test of polished and elegant speech than is the clear enunciation of unaccented syllables the test of good articulation.

In regard to rules of pronunciation, the exceptions to them are so numerous that they tend more to embarrass than to aid the enquirer, and they are rendered useless by phonetic representation.

The transitive and intransitive verbs are carefully distinguished; the irregular verbs are conjugated, and the plural forms of irregular nouns are exhibited.

The definitions have been selected from the dictionaries of Johnson, Walker, Reid, Smart, Craig, Webster, and Worcester, and, though concise, they will be found sufficiently comprehensive and exact for the critical scholar. Many technical and scientific terms have been introduced, because natural science is now taught in our best institutions of learning, and incorporated with our literature;—also, many words which are obsolete or antiquated, but which are found in books that are much read; words of local or provincial use; and a large number of words and phrases from foreign languages, often met with in modern literature. Those words which are obsolete or antiquated, colloquial or exceptionable, have been carefully noted.

In the romanian orthography the Compiler has taken as his guide the prevailing usage of the principal lexicographers. A more uniform system might have been adopted in harmony with analogy, but this would have led to greater changes in the orthography than he felt himself authorized to make. Instead of aiming at uniformity, he has preferred that mode of spelling which he found supported by the greatest number of authorities.

The Compiler has adopted the common alphabetic arrangement of words, believing it will be more convenient and acceptable to those who will use the book, than the phonetic arrangement, which is of course the more scientific.

To make the Dictionary useful as a school-book, a copious list of Greek, Latin, and Scripture Proper Names, and also a vocabulary of the most important Geographical Names, have been added, with the pronunciation represented in phonotypy. The simplicity and accuracy with which the pronunciation of long and difficult words is represented, by means of phonotypy, contrast strongly with the perplexing notation commonly used for that purpose.

As phonotypy must, from its inherent merits, sooner or later be introduced into every primary school in our country, as the most expeditious and intelligent method of teaching children to read the common print, and as it effects what no other system ever did—namely, distinct articulation—this work will be found an invaluable aid to teachers in guiding them to a careful analysis of the words of our language.

The foreigner will be enabled, by the aid of this Dictionary, to pronounce any word he may see in the common print, and read correctly the definition; which cannot be said of any other English dictionary. This peculiar feature of the work will commend itself to the missionary, who now finds it almost impossible to teach the foreigner our language.

It gives the Compiler great pleasure to state that the General Introduction was written by Mr. Alexander J. Ellis, B. A., whose gifted mind, prompted by true philanthropy, and whose ample means, have done so much in perfecting the phonetic system and disseminating its important truths. Like all his productions, it evinces a thorough knowledge of his subject, expressed in the most appropriate language. The origin and history of our present orthography is traced, showing that it is a scientific, practical, and moral failure; and even more, that it is an active enemy to education, and that the remedy is to be found by reverting to true alphabetic writing—a phonetic representation. The objections made to this mode of spelling are carefully considered and logically answered. No candid mind can fail to see their utter futility and unsoundness. The analysis of the elements of speech gives evidence of original and accurate observation of vocal phenomena carefully systematized, and cannot fail to be highly instructive to every student of science. An explanation of the principles of phonetic teaching is given, and their relations to the romanized, or ordinary method, showing that the system is thoroughly inductive, sound in theory and successful in practice. An account of a few of the numerous experiments made during the last seven years, in Great Britain and in this country, and their results, are given, showing, from the testimony of the most intelligent educators of both countries, that children and adults have been taught to read *romanically* in much less time by first learning the phonetic print; and what is still more important, that it changes the process of learning to read from a drudgery into a pleasure, attracts the attention and awakens the intellect, while it materially improves the pronunciation. The whole Introduction furnishes a text-book of principles, valuable to the general scholar, and essential to the successful teacher of the English language.

In preparing this work the Compiler has received many valuable hints from Mr. Elias Longley, who is the well-known pioneer of Phonography and Phonotypy in the West, and who has had much experience as a phonotypic printer; also, from Mr. Benn Pitman, who has been a successful disseminator of the Writing and Spelling Reform in Great Britain, and has had an opportunity of becoming acquainted with the pronunciation of the literary and well-bred portions of English society.

As this work is the first of the kind ever published, it cannot claim to be perfect. The Compiler, nevertheless, hopes, that as a school book for the analysis of words, and for correct pronunciation, or as a vocabulary for general reference, it will be found far superior to any Dictionary at present in use. He can at least say for himself, that no labor or expense has been spared to make it serve the purposes for which it is designed. It has been

carefully prepared, and the utmost attention was paid to accuracy while it was passing through the press. Should errors be found, the Compiler has no desire that they should be concealed, but will rather feel thankful to all who may assist him to correct them for the benefit of the public, whose true interests it has been his aim to serve.

MEMOIR.

NATHANIEL STORRS was born in Lebanon, in the State of New Hampshire, on the 14th of March, 1764. His father was a respectable farmer, and a descendant of Samuel Storrs, from Sutton, Nottinghamshire, in England, who came to Barnstable, in Massachusetts, about the year 1683, and in a few years removed to Mansfield, in Connecticut.

The subject of this notice received his education at Dartmouth College, in Hanover, New Hampshire, where he graduated in 1796. He made teaching the occupation of his life, and excelled in imparting knowledge to others. He was the principal of the Elliot School, in Boston, Massachusetts, from 1818 to 1826, a period of eight years, which station he filled with credit to himself and profit to those under his charge, until ill health compelled him to relinquish his labors.

As a teacher, he fully understood the difficulties experienced in the acquisition of our language, and was convinced at an early period that a radical change in its orthography was necessary to remove them. He regarded our imperfect alphabet as the primary cause of these difficulties; having but twenty-three effective letters to represent upwards of forty sounds of the English language, it was necessary to assign a variety of sounds to the same letter or the same combination of letters; consequently he viewed our alphabet as uncertain, contradictory, and false; the historical spelling of a word being no guide to its pronunciation—and conversely, the pronunciation being no guide to its historical spelling. Each word had to be learned as an independent picture or symbol, representing, as a whole, the spoken word. It was not till the pupil became familiar with the forms of words, associated with their pronunciation, which could only be learned from the dictation of a teacher, that he was enabled to read fluently; nor was it surprising that amid this labyrinth of doubt and perplexity so few learned to read well, and that *none learned to spell*.

A careful consideration of the subject led him to the conclusion that it was first necessary to determine the number of elementary sounds of our language; and secondly, that each sound should be represented by one letter only, and each letter should invariably represent one sound.

The elements being all ascertained, and represented by appropriate characters, he knew that all doubt, difficulty, and uncertainty, in learning to spell and pronounce, would disappear; and that no more difficulty would be experienced in reading and writing the words of a spoken language than in reading and writing musical sounds or numerical figures. By this new mode of representation, the children of our common schools, instead of being compelled to grope through a guessing, stultifying process of training, in acquiring the art of reading, would have their minds quickened into a healthy, vigorous

activity, and their reasoning powers be logically trained. The vexatious perplexities that serve to excite the lower propensities of both pupil and teacher, would give place to the benign influence of cheerfulness, mutual sympathy, and a consciousness, on the part of the pupil, of intellectual power, and a spirit of self-reliance. Both children and foreigners could thus acquire our language in one fourth of the time now employed for that purpose. Time, money, and labor would be saved; but, what is infinitely more valuable, the intellectual and moral training of our youth would be greatly improved, by making this important change in our orthography.

Soon after relinquishing his charge of the Elliot School, in 1826, he determined the number of elementary sounds in our language, and fixed upon the letters to represent them. This was more than fifteen years before Isaac Pitman, of England, thought of his phonetic scheme. At this time he commenced writing a Phonetic Dictionary of the English language, which occupied his leisure hours for several years, and completed more than a thousand pages. A careful analytical study of the elements of the language convinced him that he had not perfected his alphabet, and after making the desired improvements he would have re-written his work, had not the infirmities of age interfered with his favorite project.

During the year 1845, Mr. S. P. Andrews, of New York, delivered several lectures in Boston, on the science of Phonetics, in which Phonography was made the principal topic. Mr. Storrs was much interested in these lectures, and made himself acquainted with the principles of Phonography. In 1846, a report was made before the American Academy of Arts and Sciences, upon Phonotypy, by Mr. George B. Emerson. The alphabet presented in this report was one employed by Messrs. Andrews & Boyle, being one of the earliest alphabets used by Messrs. Pitman & Ellis. Mr. Storrs read this report, and pointed out what appeared to him to be errors in their alphabetic scheme. He regarded this alphabet as superior in the forms of its letters to any he had seen. Dr. A. Comstock, of Philadelphia, had adopted one, the new forms of which were mainly taken from the Greek alphabet, and they failed to harmonize, in form and general appearance, with the other letters. Mr. Storrs was acquainted with the labors of Benjamin Antrim, of Philadelphia, and with the phonetic scheme of Rev. Ezekiel Rich, of Troy, N. H., but their alphabets he regarded as impracticable.

No evidence appears that Mr. Storrs was acquainted with the alphabet as improved by Messrs. Pitman & Ellis in 1847. Ill health prevented him from giving much attention to the subject during the last few years of his life. He was much gratified to learn that phonetic representation was attracting the attention of literary men, and confidently believed it must eventually become the prevailing mode of representing spoken language.

During his last illness, he signed an indenture for the Compiler of this work to prepare and publish a Phonetic Dictionary of the English language, and directed that the expenses of writing and publishing an edition of five thousand copies of the same be paid out of his estate.

His interest in this great Reform remained unabated to the last, for he continued to converse upon it, at intervals, until he was unable to speak. He died June 16th, 1851, in his 78th year, at his place of residence, in Boston, Mass.

Mr. Storrs possessed a fine physical organization, well proportioned, and of more than ordinary height. His head was large and well formed, with a preponderance of brain in the upper and frontal region. He possessed a clear, analytical mind, well stored with useful knowledge, particularly first principles, which enabled him to discover truth where it was hidden from ordinary minds. He was an accurate observer of Nature, and would have excelled in the natural sciences had circumstances favored his early education in that

department of learning. He did not undervalue classical learning, but thought too much time was devoted to the Latin and Greek languages in our academies and colleges, and too little to the natural sciences; considering it was far better to acquire ten ideas, and be able to express them in one language, than to acquire one idea, and be able to express the same in ten different languages.

He remarked that the *observing* powers of children were first developed; that minerals, plants, and animals were given them to observe; and he thought that the young of our common schools should receive some instruction in Botany, Chemistry, Geology, and Mineralogy, that they may acquire an early habit of observing the qualities of objects, as well as their uses to man. At a later period, they should be acquainted with the functions of the principal organs of the human system, and the natural laws of health. In fact, man should be educated to be an accurate observer of Nature, and become familiar with her general laws—for Nature's laws are but modes of action of the Divine Mind, the unmistakable expression of his will.

In conversation, he was free and affable, always having a command of appropriate language to express his ideas, and generally choosing for a topic something useful and instructive. "His opinions were his own, and not the faint copy of another's mind." He mingled but little in general society, though he was highly esteemed by his intimate friends. Industry, economy, and honesty were cardinal virtues in his moral code. Idleness, the love of show, prodigality and dishonesty met with his severe rebuke. He was a man of stern integrity, but possessed a benevolent heart, for he aimed to deal justly with all, to be useful to his fellow-men; and finally disposed of his property with a view to advance the human race in virtue and knowledge.

In his religious faith he was a liberal Christian; believing that love to God was best manifested by strict obedience to his laws, and love to man, by elevating the moral and intellectual condition of his race. He loved truth in all its various forms, whether in art or science, morals or religion. The conservative spirit that is usually manifested in age, and which is a deadly barrier to progress, never took possession of his mind; for whatever subject was presented for consideration, he was always ready to test its value by first principles, believing that truth alone would promote the highest good of man.

Society will ever be grateful for the munificent gift so wisely appropriated to the highest interest of education—diminishing the toils of the teacher in imparting instruction, training the child in a pleasing logical method of acquiring our language, perfecting his articulation so that words shall "fall from his lips like new coins from the mint, accurately cut and perfectly finished," lessening the time for acquiring our language at least one half, and giving to science a valuable contribution to her vast store-house of knowledge—an exposition of the only philosophical method of representing a spoken language.

Remarks on Mr. Storrs' Alphabet.

Mr. Storrs based his alphabet upon the romanian, the letters of which he employed in their most common signification, and made the new letters, which he was obliged to introduce, in order to give each of the principal sounds of our language a distinct sign, harmonize with the old in form and general appearance. This is evident to any one who will compare his alphabet, given at the close of these remarks, with the romanian. It is the one in which he wrote his Dictionary, and is carefully copied from his manuscript, dated 1826. He rejected *q*, *k*, and *x*.

According to his scheme, there are thirteen simple vowels, six of which are

long and seven short, and arranged in pairs, the short vowel bearing a close resemblance in quality to the long one, excepting *u*, which has no corresponding long sound.

The *o* in *coat*, *whole*, *renovate*, *advocate*, &c., he regarded as essentially short, and of sufficient importance to furnish it with a symbol distinct from the vowel in *oak*, *note*, &c.

The vowel in *air* he considered a diphthong, composed of *a* and *u*, and the word *air* might be phonetically written thus: *aur*.

He employed four diphthongs, namely: *i* in *mine*, *oi* in *noise*, *ow* in *now*, and *ew* in *new*. The symbols of the last two resemble those employed by Messrs. Pitman & Ellis to represent the same sounds.

He thought Walker and his followers made a great mistake in considering the consonant *y* an essential part of the diphthong *u*. That in the word *yew*, its elements are, first, the consonant *y*, followed by the true diphthong *ew*; as in the word *dew*, *d* is the first element, followed by the diphthong *ew*. *Y* is no more a part of the diphthong in the word *yew*, than *d* is a part of the diphthong in *dew*. If it be true that the sound of *y* is contained or concealed in the long *u*, the initial *y* in the romanian notation, we should mark as silent; thus, *you*, *your*, *yule*, *Eunice*, *Europe*, must be written *u*, *ur*, *ul*, *Units*, *Urop*. The consonant *y* is the first sound heard in *yu*, *yew*, the final sound being the proper diphthong, which is formed of the brief sound of *e* in *me* and *oo* in *book*, pronounced by one impulse of the voice, and is represented by *ew*, *eu*, *eo*, &c., heard in *tube*, *yew*, *pew*, *new*, *neuter*, and *feodal*. If the elements of long *u* be *yoo* in all positions, then *feud* becomes *fyood*; *beauty*, *byooti*; *cute*, *kyoot*; *dew*, *dyoo*; *pure*, *pyoor*, a pronunciation which would be regarded as affected and ridiculous in the extreme, and opposed to the best usage of well educated persons. If it be said that *y* is slightly articulated in these words, then the *oo* becomes still more prominent, and *dew* becomes *doo*; *pure*, *poor*; *feud*, *food*; *beauty*, *booty*, and *cute*, *koot*. This is still worse, for it changes the meaning of the words, and gives prominence to the *oo*, which is never heard from correct speakers with its full open sound, but a closer one approaching the *oo* heard in *book*, preceded by brief *e*. In fact, we have no two elements that correctly represent this diphthong. Brief *e* and *ö* approach more nearly the true sound than any others. The final sound is not so round and prominent as *oo*, and can be learned only by hearing it pronounced.

There is still another corruption fast gaining ground among those who regard long *u* as composed of *y*, *oo*; they pronounce *duty*, *juty*; *duration*, *juration*; *dew*, *jew*; *duel*, *juel*. This arises from the effort to articulate *d* and *y* in rapid succession, which will produce *j*.

Dr. Latham makes a distinction between *ew* and *yoo*. In speaking of the tendencies of language, in his work on the English Language, (p. 177,) he remarks: "From p. 153, we see that the combination *ew* is an unstable combination, that it has a tendency to become *yoo*, and that the *y* in *yoo* has a tendency to change a *d* into *j*; in other words, we see the reason why by many persons *dew* is pronounced *jew*."

Mr. Storrs employed a symbol for the syllables *ur*, *er*, *ir*, *or*, which he considered the same in their elements, namely, *ur*.

His analysis of the compound consonants *ch*, *j*, *sh*, and *zh*, he regarded as very important, and the only one which correctly represents their elements.

The Compiler has aimed to present the phonetic scheme of Mr. Storrs as it was developed by himself, with those views of elementary analysis which differ from other orthoepists. In all its leading features, it bears a close resemblance to the one employed in this work, and, what is still more remarkable, even the *forms* of many of the new letters are almost identical.

GENERAL INTRODUCTION.

1. Articulate Speech the Privilege of Man.

Mig. 767 — Articulators — thus did Homer acutely distinguish man from the lower animals. For it is vain to deny language to the beasts of the field and the birds of the air. Look at that dog: how his eyes sparkle with pleasure, how he trembles with expectancy, how he whines with dread, how he makes you feel his love, hate, indifference, doubt; how he informs you of danger, how he welcomes you home, drives off the intruder, and protects your property! Is there no language in his snarl, his short, impatient bark, his cry, nay, in the very lick of his tongue and wag of his tail? There is not only a language, but one which is understood over the wide world. It is a language of sentiment and imagery, but there is no articulation. That is reserved for man. Wherever two or three human beings are thrown together, there will be found a set of sounds, as garbs of thought, invented, understood, acknowledged, used, remembered, and reëmployed by a kind of freemasonry very falsely called convention. It is a spontaneous offshoot of our nature, the golden thread of our being which winds humanity into one, past, present, and to come. But how the past?

"The actor's wondrous art
Goes swift and trackless past the sense it stirs."

("Denn schnell und spurlos geht des Mimen Kunst,
Die wunderbare, an dem Sinn vorüber.")
Schiller.

The words of to-day live but feebly in the recollection of to-morrow; the tales of the father, themselves a faint impression of the event, scarcely move the son, and are lost to the grandchild. Tradition is a most uncertain guide. We must fix the thought as it arises, and leave it a monument for all ages to admire. When death has struck down the noble friend that thought it, the word shall survive in a true immortality. Where writing has not appeared, human progression is slow and uncertain. Letters are the gentle dew which roots the present in the past to develop in the future.

2. Writing the Mode of connecting the Present with the Past and Future.

As the connection of man with the past is more valuable than his union with the present, inestimable as the latter may be, so is writing more valuable than speaking. Without the work of past ages bearing upon the present, without the knowledge accumulated from all time, which we can only hope to hand down with a small and ever smaller increase to our posterity, we should be like the tribes of animals, who, guided mainly by an instinct which is in man concealed by the brightness of his reason, begin life afresh in each generation, and are the same now as when they were first observed. On the contrary—

One by one,
Since its time begun,
Waxeth our race beneath the sun.
Knowledge stored,
In noble hoard,
Travels increasing from sire to son.
Thus humanity's course is run;
Thus it will grow 'til its time is done.

The engraved character, the painted letter, these are the talismans which make man immortal, the true cane in which Prometheus brought down the fire from heaven.

3. Origin of Alphabetic Writing.

But how shall these characters or letters store up thought? What connection is there between a mark and a thought, a letter and a word? The genius of man has not been slow in discovering associations. The first thought seems to have been to draw sensible objects, to represent these and the actions chiefly done with, to, or by them, and the feeling which these actions inspired. Such were the hieroglyphics, which, hastily written and altered in the course of time, gave rise to a set of characters having scarcely any traceable connection with the original objects, and therefore considered to be entirely conventional, such as we see in the extraordinary symbols of the Chinese. Or again, parts of objects were drawn to suggest their names, and then the initial sound of that name was held to be alone in

tended, and by placing these symbols together, a compound sound was represented, having a known meaning in the spoken language of the country. Such seems to have been the origin of the Phœnician characters.

This was a great step. Instead of recalling the thought, the sound by which that thought has been expressed is alone recalled. And more than this, it is recognized that this sound is compound, that all the sounds uttered or utterable are composed of a few elements, and that by analyzing them into these elements and then recombining them, we can form the whole language by a repetition of simple characters. Writing thus ceased to be symbolical, and became alphabetic. Where this was first accomplished we cannot say. We have a rude attempt in the Phœnician alphabet, but in other Asiatic tongues we have marvellously correct results, as in the far-famed Sanscrit, where the shades of sound are so accurately represented, that we can almost read the *Mahābhārata* better than our own Chaucer.

But Europe lay to the west and took the westernmost alphabet. "A knowledge of this fact is of the utmost importance," observes Dr. Donaldson, New Cratylus, 2d ed. p. 116, "for the chief difficulties occasioned by the Greek alphabet have arisen from the circumstances that its whole organization is adapted to a language as widely different as possible from Greek, and, that while the names and shapes of the letters have been retained their value has been materially altered." But not only is this a source of trouble in Greek, it passed thence to Latin, and thence, as the temporal and afterwards the spiritual arm of Rome weighed heavily over all the countries of Europe, the Latin form of this Phœnician alphabet became fitted upon languages still less adapted to receive it, and difficulties grew from difficulties, till the confusion worse confounded, of the English and French orthographies, spread around its tangled meshes.

4. *The Alphabetic Principle and its Degeneration.* The principle of alphabetic writing is this: *To analyze the sounds of speech into their simple elements, to invent a sign which shall accurately represent each element, and by combining the signs to represent the sound resulting from the vocal combination of the elements.* This is the whole object and intention of alphabetic writing. Thus in the Sanscrit language every change of sound was accurately represented by a change of letter. If the concurrence of two sounds was accompanied in speech with an alteration in one of them, for ease or beauty of utterance, that change, although it might only be temporary, as in the casual meeting of two words, was marked in the orthography. The euphonic laws which grammarians have detected as influencing these changes occupied no less than 30 pages in Bopp's *Kritische Grammatik der Sans-*

krita Sprache in kürzerer Fassung. It is important to note this, because the Sanscrit language is the great storehouse whence comparative etymology draws her treasures. As, however, time went on, this original alphabetic feeling became more or less lost. The Greeks, indeed, changed their spelling scrupulously to imitate change of dialect, (with which we should have been otherwise unacquainted,) and we find the Latin orthography varying in different ages. It might have been expected when the German "barbarians" put on the Latin alphabet as they did the Latin spoils without much regard to fitness, that orthography should run wild, but still it was better in intention than that we now have. The alphabet of Ulphilas the Goth is a very creditable performance. The alphabet which Cyrillus formed for the Slavonic languages has founded the practical working system of writing now used in Russia. But it was in such countries as France and England that the greatest confusion arose from the confusion of languages. In England the original Runie letters of the Anglo-Saxon were gradually disused and their place supplied, very imperfectly, by Roman letters. With great variety of dialects there was, necessarily, great variety of spelling. Then came the Norman invasion, with the introduction of a language already mixed, and rulers who were ignorant of Saxon. Hence arose a mixture of the languages and a confusion in spelling, for "clerks" of Saxon origin wrote words half Saxon and half French, and others of Norman extraction puzzled over the Saxon words. At length as the languages became thoroughly fused into English, and laymen learned to write and tried their hands at spelling—principally their own names, however—all rule seemed to be broken through. The same words in the same page were written in different ways. People did not seem certain about their own name. The Percies of Northumberland contrived to write their name in 15 different manners; Lord Burleigh did not know how to spell Lord Leicester's name, and for the matter of that Leicester himself had eight different ways to choose from.

5. *Fixation of the English Orthography by Printing.* But the era of printing had arrived, and it was hard to spell differently on the same page. Printers' journeymen soon found that it was very troublesome to follow the manuscript letter by letter; it was easier to remember one form, or nearly one form of spelling a word, and to pick up the types by memory. Printers' readers encouraged uniformity for the beauty of the page, and something like a definite system of spelling gradually worked its way into *printed books*—*printed books*, observe, not *manuscripts*. It is a very great mistake to confound the two, and unless books are professedly printed *literatim* from the author's manuscript they are no proof whatever of the style

of spelling which he advocated. It is necessary, however, to bear in mind that the true reformers of our English spelling, the true source whence we can trace our present approach to uniformity, with differences not amounting to much more than one word in sixty, must be looked for in the *printer's reading room*. Of course the printers' readers, though at first literary men, could not be considered in reality to be of much weight as literary authorities. They were glad themselves to adopt some acknowledged authority when they could find it. The age of lexicography came, and the printer's reader clung to his dictionary as a sheet anchor. But how did the writers of dictionaries proceed? Hear what Johnson says:

6. Dr. Johnson's Orthographic Difficulties. "Of this kind [anomalous formations, which, being once incorporated, can never be afterwards dismissed or reformed,] are the derivatives *length* from *long*, *strength* from *strong*, *darling* from *dear*, *breadth* from *broad*; from *dry*, *drought*; from *high*, *height*, which Milton, in zeal for analogy, writes *hight*. "*Quid te exempta juvat spinis de pluribus una?*" [How are you advantaged by removing a solitary thorn from out a multitude?] To change all would be too much, and to change one is nothing.

"This uncertainty is most frequent in the vowels, which are so capriciously pronounced, and so differently modified by accident or attestation, not only in every province, but in every mouth, that to them, as is well known to etymologists, little regard is to be shewn in the deduction of one language from another.

"Such detects are not errors in orthography, but spots of barbarity impressed so deep in the English language, that criticism can never wash them away; these, therefore, must be permitted to remain untouched; but many words have likewise been altered by accident, or depraved by ignorance, as the pronunciation of the vulgar has been weakly followed; and some still continue to be variously written, as authors differ in their care or skill: of these it was proper to inquire the true orthography, which I have always considered as depending upon their derivation, and have therefore referred them to their original languages; thus, I write *enchant*, *enchantment*, *enchanter*, after the French, and *incantation* after the Latin; thus, *entire* is chosen rather than *intire*, because it passed to us not from the Latin *integer*, but from the French *entier*.

"Of many words it is difficult to say whether they were immediately received from the Latin, or the French, since, at the time when we had dominions in France, we had the Latin service in our churches. It is, however, my opinion, that the French generally supplies us; for we have few Latin words among the terms of domestick use,

which are not in French; but many French which are very remote from the Latin.

"Even in words of which the derivation is apparent, I have been often obliged to sacrifice uniformity to custom; thus, I write, in compliance with a numberless majority, *convey* and *intreigh*, *devail* and *receipt*, *fancy* and *phantom*; sometimes the derivative varies from the primitive, as *explain* from *explication*, *repeat* and *repetition*.

"Some combinations of letters, having the same power, are used indifferently without any discoverable reason or choice, as in *chuck*, *choker*; *stake*, *peg*; *frack*, *jack*, and many others; which I have sometimes inserted twice, that those, who search for them under either form, may not search in vain.

"In examining the orthography of any doubtful word, the mode of spelling by which it is inserted in the series of the dictionary, is to be considered as that to which I give, perhaps not often rashly, the preference. I have left, in the examples, to every author, his own practice unmolested, that the reader may balance sufrages, and judge between us; but this question is not always to be determined by reputed or by real learning; some men, intent upon greater things, have thought little on sounds and derivations; some, knowing in the ancient tongues, have neglected those in which our words are commonly to be sought. Thus, Hammond writes *feibleness* for *feasibleness*, because, I suppose, he imagined it to be derived immediately from the Latin; and some words, such as *dependant*, *dequend*, *dependance*, *dependence*, vary their final syllable, as one or another language is present to the writer.

"In this part of the work, where caprice has long wanted without control, and vanity sought praise by petty reformation, I have endeavoured to proceed with a scholar's reverence for antiquity and a grammarian's regard to the genius of our tongue. I have attempted a few alterations, and among those few, perhaps the greater part is from the modern to the ancient practice; and I hope I may be allowed to recommend to those, whose thoughts have been perhaps employed too anxiously on verbal singularities, not to disturb, upon narrow views, or for minute propriety, the orthography of their fathers. It has been asserted, that 'for the law to be known, is of more importance than to be right.' Change, says Hooker, is not made without inconvenience, even from worse to better. There is, in constancy and stability, a general and lasting advantage, which will always overbalance the slow improvements of gradual correction. Much less ought our written language to comply with the corruptions of oral utterance, or copy that which every variation of time or place makes different from itself, and imitate those changes which will again be changed, while imitation is employed in observing them."

7. *Loss of the True Alphabetic Principle and Rise of Lexicographic Authority.* The reader cannot but be struck, on reading this remarkable passage, with the total obliteration of the original intention of alphabetic writing. Doctor Johnson inveighs against writing as we speak; when in doubt, he does not trace the real phonetic history of the word; he looks merely to see what nation introduced it, and endeavors to indicate this by some peculiarity of orthography, which could evidently only inform those who were already in the secret, and at the same time he gives in without any reason at all but inveterate custom, to diversities of spelling which neither sound nor derivation justifies. It is impossible to give a more graphic picture of the imbecile state of the English orthography.

But Johnson was a "great" lexicographer, and printers' readers at once accepted him. They have abandoned him now. Walker and Smart, and then Webster and Worcester, have replaced him in the estimation of the readers, and thus our spelling has changed, as any one who reads the above passage (which is spelled as Johnson printed it) will readily perceive. Thus dictionary makers *do* settle the spelling, for they settle the practice of the printing office, and writers endeavor in general to write like a book. And yet read what a writer in the *Penny Cyclopædia*, (vol. 17, p. 41,) says, truly representing, as we know, the feeling of many literary men:—

"We perceive, by certain Grammars and Dictionaries published by practical men, both at home, and still more in the United States of North America, that the writers appear to suppose that their works will be resorted to, even by persons of cultivation, as authorities or guides to orthography. But we believe it to be the case, that the number is very few of persons who actually use dictionaries for this purpose. We mean, of course, not mere children, or persons of very imperfect education, but even of those there are very few persons who read much and write occasionally, who ever think of resorting to books of the kind we are speaking of; and persons of a better education still trust entirely to memory, and should a doubt arise, the reference would be made to some eminent author, and not to the guides of which we speak. In fact, the art is acquired almost without teaching, and is maintained in vigor through a whole life by the constant practice of writing and reading. At all events, there is no book, grammar, guide, or dictionary, which a scholar in England regards as in this point a book of any authority. . . . Practically a great, and perhaps quite sufficient degree of uniformity and stability, may be said to be secured under the regulating power that now exists. Dictionaries and vocabularies, as affording an easy guide to the knowledge of what is the usage, may

have their use in this respect to a few persons who write occasionally only, but, as authorities, we repeat, they are of no avail."

8. *Estimate of the Degree of Fixation in our Present Orthography.* But is our spelling fixed after all? Mr. Worcester, in his dictionary, gives 1495 words as spelled different by different authors, of which no less than 126 are spelled in *more* than two different ways. If we take our language as consisting of 90,000 words, this alone gives about one in sixty as still unsettled. And from this calculation we have thrown out of consideration whole classes of cases in which usage differs; as, (1) whether we should write *our* or *or* in *ambassador*, *anterior*, *arbor*, *ardor*, and so on, (in fifty-nine cases Dr. Johnson writes *our*, and in forty *or*;) (2) whether the *l* should be doubled or not in the past tense of such words as *apparel*, *bevel*, *bowel*, &c., that is, whether we should write *appareled* or *apparellled*, &c.; there are no less than fifty such words; (3) whether *t*, *p*, should be doubled in the past tense and participle of words like *benefit*, *develop*, &c., fourteen in number; (4) whether we should write *centre* or *center*, &c.; (5) whether we should write *patronise* or *patronize*, &c., in at least ninety verbs ending in *ise* or *ize*; (6) whether or not we should retain the *e* in abridgement, judgement, &c., and in blameable, &c.; (7) whether a double or single *l* should be written in compound words formed from monosyllables which have the double *l*, as *appall*, *befall*, &c.; (8) and, which is the style of spelling to be adopted in classes of words represented by the following pairs: *inquirer*, *enquirer*; *negotiate*, *negociate*; *control*, *controll*; *expense*, *expençe*; *allge*, *alliedge*; *complete*, *compleat*; *connexion*, *connection*; *precede*, *preceed*, &c. If these were taken into consideration the proportion would be much increased. It must be owned, however, that there is very little diversity in the thirty or forty thousand words in commonest use, so far as printed books are concerned, and those persons who do not imitate them are generally looked upon as true Pariahs, unfitted for the society of the elect. Yet would we endeavor to discover a reason for the spellings we employ, our rules become all exceptions, because, as the preceding brief but only too truthful history shows, no one law has regulated our custom.

9. *Our Present Orthography a Scientific Failure.* The result is, then, that the English language is represented by a series of signs which, originally deduced from phonetic considerations, are now totally inadequate to represent the sounds uttered, and that it may be asserted with perfect truth, that no Englishman can be sure how to pronounce a word which he has only seen and never heard, or how to write a word which he has only

heard and never seen on paper. It is true he may approximate both to the sound and to the form, and the more he has read and written the more close will his approximation be, and he may even hit upon the exact sound or form, but it must be guess work, for there is absolutely no guiding principle whatever.

Now it requires but a brief consideration to condemn this state of things, which is much worse than the Chinese, because, in the Chinese characters there is so much plan and system that when the radicals are known, some conception of the thought intended by the complete sign can be formed, whereas, when the alphabet is known, no proper conception can be formed of the sound of the word represented. We must therefore condemn the present English orthography as not fulfilling the purposes for which spelling was invented, while at the same time, as will be soon shown, see § 22, it does not fulfil the purpose which those who would preserve it think it suited. It does not show the meaning or origin of the word, and thus lead to the conception of the thought instead of the conception of the sound. Were the orthography then a scientific invention, instead of an historic growth, it must be condemned as a scientific failure.

10. Our Present Orthography a Practical Failure. Did its bad effects end here they might be borne with. But this is far from being the case. A system of writing which proceeds according to no rule, and therefore ceases to be a system of alphabetic writing altogether, (using the term in its proper sense, is, in fact, a system by which each word has a separate, independent symbol, which must be individually committed to memory so that the sound should recall the sign and the sign the sound, and the only advantage of having these symbols composed of portions of a series of 26 known and named forms, is the greater readiness with which the eye discriminates them, and the parts of each symbol may be described in words. In point of fact all the ordinary systems of teaching to read and spell proceed upon this fundamental fact. One system, known as "the look and say" method, does so without disguise; the teacher points to a word and utters the sound, and proceeds in this way with every new word until the child recognizes it when shown again. In other systems the fact is more or less disguised by teaching first the names of the several constituent parts. But in all systems the mode in which spelling is taught displays the principle in all its naked ugliness. Column after column of dull symbols have to be committed to memory by naming the letters of which the words are composed, the most tedious, most irksome, most irrational exercise of a child's memory which it is well possible to conceive.

If we then conceive spelling as a contrivance for rendering the communication of ideas and their preservation easy and rapid, we must condemn the present orthography as a *practical* failure.

11. Our Present Orthography a Moral Failure. But there is a higher sense still in which our spelling is a failure. To give mankind the benefit of the experience of past ages, which, as we have stated, mainly distinguishes man from brute, it is necessary that one of the first things a child is taught when he is educated, should be the art of reading, to be closely followed by the art of writing. He has to learn how to receive and to communicate. Nearly the first thing, then, on which his mind is exercised under the present circumstances, is to commit to memory the strange and confused system of spelling which disgraces our language. He is therefore practically taught to regard the subjects on which he is exercised as subordinated to no rule. The meaning of *here*, or the constant relations of phenomena as respects similarity and succession, is not only withheld from him, but is rendered almost absurd.

Who would teach the idea of physical law from the changes of the weather? Those of our spelling are only less numerous because the number of our words is limited. The child learns, therefore, practically, in its first lessons, to yield to authority blindly, to sacrifice all reason, all common sense, all knowledge, at the shrine of custom and routine,—to take his master's word and ask no questions. The mind is cramped, confined, sent back into its polyph cell, instead of evoked (*evoked*). A great moral and logical injury is done to the child's mind, which it requires many years of other education, years of instruction in physical knowledge to eradicate, if it indeed ever be eradicated. Hence, viewed in connection with education, our spelling is a great moral failure.

12. Our Present Orthography an International Failure. But its faults do not end with the nation that uses it. It spreads to other nations. A great commercial people like the Anglo-Saxon race, which holds Britain and the United States, must be constantly brought into connection with other nations. It becomes of the utmost social and international importance that they should understand each other's language. This can generally be effected only through writing, and must at any rate be principally carried on by writing. A system of spelling, then, which is so difficult to acquire as the English, a system which affords no information whatever to the foreigner as to the sound he has to give the words in order to be intelligible to English speakers, cannot but be regarded as a great commercial and international failure.

13. Our Orthography an Active Enemy to Education. It would be easy to show that our spelling is an esthetic failure and a philological failure; that it prevents us from acquiring some uniform standard of pronunciation, or from learning the real changes which have taken place in the course of ages during the formation of our language; that it throws great hinderances in the way of our study of comparative philology and the acquisition of modern languages for the sake of practical intercommunication; but on these matters we forbear to dwell. They must occur to every thinking mind. They are borne out by constant experience; they are of the things which admit of no doubt.

But it is necessary to recur to the educational effects of our present orthography, for they are at once the most important, and the most generally felt. The one great point is, that *with our present spelling it is a long and very difficult process to learn to read, and a still longer and more difficult process to learn to write.* The consequence is that children are forced to waste years over acquiring the power to use the mere *tools* wherewithal to dig out knowledge. In Great Britain, where there is no organized system of common schools, and where children go to school very young, and leave after spending, on an average, not more than eighteen months at school, it has been calculated by the acute school inspector, Rev. Canon Mosely, that "probably one half" of the children who frequent the English national and other schools for the working classes, "must leave the schools and be absorbed into the laboring community of the country not being able to read." (*Minutes of the Committee of Council on Education, for 1845*, vol. 1, p. 228.) Now, although it by no means follows that those who can read and write, aye, and read and write with the greatest ease and correctness, are in any respect *educated*, yet it is quite certain that those who are *not* able to read and write with some degree of ease, are entirely uneducated. The system of instruction at our schools does not admit of education being conducted without reading and writing.

The great social misery, then, which English spelling produces in England, is the want of education among the people. And even in the United States, where every child enjoys the opportunity of instruction in the common schools, the time which is still wasted over the necessary preliminary of learning to read, detracts much from the value of the education given, because it deprives the teacher of opportunity to give that other instruction and that other *training* which constitutes real education, while the very circumstance of having to teach a subject of the nature of our orthography, gives the child a false training, a bend in the wrong direction, a something to unlearn in his very first learning.

The process of instruction in reading is therefore not merely no assistance to other teaching, but absolutely a detriment. Our orthography is therefore an incubus which all educators must be desirous of searing; not merely a passive obstacle to be overcome, but an active enemy which is perpetually leading the pupil into false paths.

14. The Remedy---a Recurrence to True Alphabetic Writing. Is this a necessary evil? Must we accept what is, because it is, and make no effort to improve? Is that spelling which every succeeding age has already altered, to remain stereotyped in the nineteenth century? Is learning to stand still when all the rest of the world moves? The questions answer themselves. We have only once to get a conviction of the evil firmly fixed in the minds of the Anglo-Saxon race, with a clear perception of the remedy, and the change will be made. Now wherein the remedy lies is very clear. It simply requires a recurrence to the original scientific principles of alphabetic writing. We must carefully analyze the sounds which we utter, give characters to each simple sound, and combine these characters for the words. This is not an easy task, but it can be done, for it has been done in Asia over and over again, and done successfully too. Modern Occidentals do not yield the palm of intellect to the Orientals. Suppose it done, and it will be shown in the latter part of this introduction how it may be done sufficiently for all the practical purposes of life, what will be the benefit?

15. The Benefits which would result from the Change. We have only to reverse the censures passed upon the ordinary spelling to arrive at an estimate of the new. A child once instructed in the elementary sounds and the method of combining them, together with the characters by which they are conventionally represented, will know instantly, as soon as he sees a written symbol, what sound he is to utter, and as soon as he hears a spoken sound, what symbol he is to trace. Within three months may this knowledge be acquired by a child of four or an adult of forty. The gate of knowledge would be thrown open with both its valves. To read would be to hear, to write would be to speak.

Other nations would be readily able to comprehend our language, the easiest in the world to acquire but for its present orthography, and destined to be carried over the whole globe by the energy of its speakers. The years now wasted in learning a dull catalogue would be saved. A small portion of the time would be pleasantly spent at the commencement of a child's schooling, or before he goes to school, under the care of his mother, in acquiring the true sounds of language, putting them together, and connecting them with the symbols of writing,

thus giving him a practical acquaintance with analysis and synthesis, and a feeling for symmetry and law. He will also learn the advantage of knowledge and its test; he will find that he knows, because by applying the simple rules he has learnt he can discover new results. He will thus be able to understand, vaguely of course, at first, as all children understand, the use of being taught, the use of going to school. He will see the value of a teacher's instruction, and will yield him, not a blind, but an intelligent obedience. Hence we may look forward to such a change as a national blessing, to be earnestly striven for with heart and soul.

16. These Benefits will not Result unless Proper Use be made of the New Spelling. It is not pretended that a scientifically correct system of spelling will produce all these social benefits of itself. The system of reading and writing may be extremely easy, and yet people may never be taught to read. In no country in Europe is the orthography better or more consistent than in Spain, but we could not cite Spain as an instance of a high state of education. In Holland the orthography is also very good, and the state of education is very high. In Austria proper, although no improvement has taken place in the German spelling, (which is certainly very superior to the English,) every child is taught to read and write. But no good results from this, because books are withheld from the reader with jealous care. A knife, however sharp it may be, will not cut unless it be used. Good tools do not make good workmen. It is not enough to have a good system of spelling; it is necessary to put it to its full use. The reason why the speakers of the English language should strive so earnestly to improve their spelling, is not that they cannot produce a good effect with the one they have, but even because they *are* such good workmen as to do well with the miserable tool they have inherited from the literary anarchy of their forefathers, therefore they should strive to possess themselves of that much better instrument which science presents to them, and which they could employ with such immense effect. We do not deny the advantage of a corduroy road over none at all; we do not pretend to abuse the Macadamized causeway which we have used so many years with the greatest advantage; but this is no reason for our not introducing railways, any more than the excellence of the semaphore should debar us from the electric telegraph. Writing was good, printing was better; any orthography was better than none at all; but any simply historical and un-systematic orthography must yield to Phonetic spelling.

17. Objections to the Change---from its Strangeness. Now there is no abuse however flagrant, no custom however inconvenient, no ab-

surdity however glaring, which will fail to find advocates when once established, or which those who have practised will not find arguments to retain. Those who have been accustomed to read and write much, who have acquired their habit by a long and on the whole, painful series of trials, are unwilling to have their habits altered, and are even fearful of injuring them, so slight is their hold, by turning aside for a moment to something else. Words in the old spelling, that is to say, thousands of the commonest words, more or less, according to the habits of the person, have become familiar objects, old friends, which it distresses them to traverse. They find a set of new characters strange and unsmooth, something as ludicrous as the first umbrella, a thing to be laughed at, not tried. This is very natural, and we are old enough to recollect similar objections to the great ugly locomotive, with its shrill scream and fire-spitting mouth, as compared with the neat turn-out and the four spirited horses of the stage-coach. Yet we have lived to find a railway train the theme of poetry.

In sober earnest, those who object merely to the strangeness of the new spelling, while the old itself appears most strange, most unaccountable, to those who have begun with a phonetic orthography, remind us of those who defended the use of the wig in preference to the natural hair, while the persistency with which English judges and barristers, the first English churchman, the first English nobleman, and the first English commoner, cling to horsehair covering in lieu of, or rather superadded to their own, serves to show the *vis inertia* of things as they are, in resisting every inducement to change. No doubt the "periwig-pated" Roman heroes that figure on pedestals as representatives of the king's soldiers and statesmen of our James and George days, were thought the *ne plus ultra* of correct taste at the time, and we may weep to see a Roman soldier figuring on the Crimean medal of the present day, as a proof of the inveteracy of mere custom unsupported by any show of rationality. But the world *does* move, in spite of all assertions to the contrary, and mere custom will give way to established knowledge. It is therefore unnecessary to argue with those who would reject phonetic spelling merely because they are used to another orthography. Some stronger arguments must be used.

18. The Conservative Objection to Change. Dr. Latham has said: "*In respect to phonetic spelling there is only one valid reason against it; and that is the existence of the non-phonetic system.* Whether this be conclusive, or whether it is more weighty in itself than any number of other reasons combined, is another matter. As it is, the contest is a mere question of relative strength,

—reformer versus conservative. All parties, however, are the better for knowing the worthlessness of all other objections beyond the single great one of difficulty in execution." (*Educational Times*, Aug. 1840.) It is necessary that the full force of this objection should be understood. It is not simply the unwillingness to change a custom, but it arises from a belief that the inconvenience of the change will more than counterbalance the advantages. Now, the main inconveniences are presumed to be, first, that every one will have to go to school again, and learn a new system of spelling; and secondly, that all our old books and libraries will become worthless, as it will require a special study to understand them. With regard to the first, it is sufficient to state that one day would be sufficient to teach any intelligent adult who is already acquainted with reading in the ordinary print to acquire the power of reading *his own language* phonetically. This inconvenience is therefore very slight. Also, as this acquisition of the power to read phonetically would not, in any way, detract from his present power of reading according to the historical print, which, as it was derived from the Romans, will be henceforth, as a matter of convenience, styled the *Romanic*,) he will be able to read all the books already in existence just as easily as before. He would also derive the information which phonetic books can alone bestow, and he would find the value of phonetic spelling in a thousand little ways. He need never trouble himself to learn phonetic writing. It will be sufficient for his descendants to do that.

The first part of the objection may be therefore disposed of at once, or resolved into the mere *vis inertiae*, which can only be overcome by allowing a generation or two to die out, for as it is not due to reason it cannot be overcome by reason.

The second part of the objection sounds much more formidable, but it is in reality no objection at all. It has been proved by numerous experiments, repeated under so many different circumstances as to leave no doubt of the matter on the mind of any one acquainted with them, that if a child be taught to read *well* in the phonetic spelling, he acquires the power of reading in romanic spelling almost without any instruction at all. Indeed, when the forms of the phonetic letters are selected with that view, we may assert as an experimental fact, that *the shortest and best method of acquiring a knowledge of our present romanic orthography is to commence by studying the phonetic*. This will be explained hereafter, (see § 46 to 48,) but admitting it for the moment, it disposes of the objection altogether, for phonetic spelling instead of rendering our libraries useless, will only make their treasures more accessible, for it will make more readers than ever of the style of spelling in which they are couched.

Those, therefore, who desire to introduce a phonetic system of spelling—spelling reformers as they call themselves,—must bear in mind that the only chance which they have of succeeding, because the only means they possess of overcoming this conservative objection, lies in establishing the fact that their system of spelling when used as a mere auxiliary for teaching to read in the ordinary print, will make pupils acquire the power of ordinary romanic reading and spelling more rapidly, more easily, more intelligently, and with better effect upon their subsequent education, than the systems of teaching to read now employed. That is, all spelling reformers must become *reading* reformers. It is the condition of their success.

19. *Three other Principal Objections stated.* The other objections urged against the introduction of phonetic spelling may be reduced to three;—many more have been brought forward, but they are not worth the trouble of enumerating, and Dr. Latham has, in the passage just quoted, broadly stated that even these three are perfectly worthless. They are more or less widely entertained, however, and no person can moot the question of phonetic spelling without meeting with them. They are, first, that many words now sounded alike differ in their spellings, and have a corresponding difference in their significations, which distinctions would be lost if phonetic spelling were to prevail; secondly, that the language is continually changing, and that a phonetic orthography would, therefore, also be continually changing; and lastly, that the etymology and history of words would be totally obscured by the changes proposed to be made in the spelling. These objections must be considered a little in detail.

20. *Objection on the Score of Ambiguity.* With regard to the first, it would have some weight if every difference of meaning were discriminated by a difference of spelling, or if the differences of spelling were originally intended to draw attention to and distinguish the differences of meaning. Neither of these is the case. If we read of "Kitty dancing *at a ball*," and "Jacky kicking *at a ball*," the words in italics are the same both in sound and sign, but the signification widely different, and yet unmistakable. If we admire Rossini's *airs*, are they his music or his manner? If a man of *light* weight enter a *light* room and *light* from a carriage with a *light* heart, or display *light* manners, or *light* a cigar, we use the same word in sign and sound in each case, but how different in meaning! A *bay* tree, a *bay* window, and a *bay* horse have certainly no connection in meaning or in origin, yet they are all spelled alike and sounded alike. Take the list of 309 "equi-

vocal words" in such a little book as Butter's *Etymological Spelling Book*, and observe that in all these, although no difference of sign is made for the difference of meaning, yet he is a bad speaker or writer who allows his sentences to be ambiguous, unless, indeed, he be a determined punster. But this list is very incomplete. Almost every noun we have can be used as a verb, and yet we make no difference in spelling. we used to do so, and it was thought to be a sad pity and a great loss to clearness of language when the initial capital letter of noun substantives was discontinued. The Germans still retain it, with the exception of the greatest authority on the German language, Grimm himself. Then, we may add, that the literal and figurative meanings are never discriminated, although of the last importance, nor are the primary and secondary. In fact, when a difference of spelling occurs, it generally shows that there was an original difference of pronunciation, which has now been lost, as in *rite*, *write*, *right*, *wright*. These cases will be reduced to the same category as the meaning of *right* in "my right hand; I claim my right; you are right; a right line; he will right you," etc., the context in every case must show the meaning. An isolated word seldom expresses its whole meaning. It changes, like the reflection in water, with surrounding objects.

But we must also turn the picture. There are not only many words pronounced alike when spelled differently, but others which are pronounced differently in different senses but are still spelled alike. "Thus, we lead a person to a lead mine; we object to an object; a cat, it is said, lives many lives," &c. In all these cases perspicuity will clearly gain by a change of spelling. But there is no need to waste words over such an objection, because whatever confusion can be made is already made in speech, and what speaker would think of stopping in the middle of a period to explain that he meant *beech* and not *beach*, or *have* and not *beast*? And if no ambiguity is felt in the rapidity of speech, what ought to be looked for in the deliberation of reading?

21. **Objection on the Score of Mutability of Pronunciation.** Mr. Trench, in his *Lectures on the English Language*, remarks: "At present in all languages it is the written word which is the conservative element in them. It is an abiding witness against the mutations or other capricious changes in their shape, which affectation, folly, ignorance, and half knowledge would introduce. It is not, indeed, always able to hinder the final adoption of these corrupter forms, but yet opposes a constant and very often successful resistance to them. With the adoption of Phonetic spelling this witness would exist no longer; whatever was spo-

ken would have also to be written, let it be never so barbarous, never so great a departure from the true form of the word."

Now observe the illogical feeling which pervades this remark. If spelling had not been primarily phonetic in intention what witness could the spelling of a word bear to its pronunciation? And if spelling is phonetic in intention, when and how and by what means did it cease to be so? In fact it has not ceased to be so, and down to this very day we have changes made in words, solely owing to their sounds. The English government have just issued a penny stamp, bearing the words "One Penny. Draft payable on demand, or receipt." Are we to accept this as the spelling of *draught*? Is not this as great a concession to mere pronunciation as *luf* would be for *laugh*, and in precisely the same direction, already pointed out by *dearf*, (from the Anglo-Saxon *deorh*, or *deceorh*, high German, *zuegrt*.) What is *receipt* (with its unpronounced *p*) itself but a concession in the introduction of the *i* to prevent its being sounded *re-cept*? In its cognate *decrit* the *p* was hopelessly gone even in Johnson's time.

And how long has it been ascertained that the spelling of a word is an abiding witness to anything? Do we spell as our forefathers? Chaucer wrote *parfit*, we write *perfect*: why? Is it supposed that the pronunciation has remained unaltered? "Open any book printed in the reign of Queen Anne, and many words will present themselves in an orthography very different from that in which they would now be found. If we ascend still higher, and go to the reign of Elizabeth, we find the orthography still more diverse from our own, and when we reach the time of Caxton, and still more when we go back to the time of Chaucer, (1396, and Wicliffe, 1387,) we find many words which, though they are actually words now in use, are so disguised in their orthographical form that we can scarcely recognize them. We seem to have got among a people who spoke a different language, though they were our own forefathers not more than ten or twelve generations above our grandfathers." (*Penny Cyclopædia*, vol. 17, p. 41.) This is a strange "abiding witness" to cite, which changes so rapidly as to be scarcely recognizable.

But in another sense the word is an abiding witness; it shows what the pronunciation was, and the changes in the word show what the change of pronunciation has been. Owing to the scientific imperfection of our alphabetic system this is shown very indifferently, only to those who have studied the subject, and to them but as a glass darkly. Had a strict phonetic orthography been always in use, we should have had a record of the progress of our language, which would have been invaluable. At the same time the very existence of a strict style of phonetic spelling would have tended to

keep the language fixed, as each reader would have known what the writer meant to utter. This, of course, is an effect which will increase with the number of books and readers. Languages change most rapidly where communication is imperfect; and phonetic orthography acts as a perpetual means of communication. So far, then, from deprecating a change in spelling when a real change takes place in sound, we should court it. We should know why some persons now say, with Lord John Russell, that they are "*greatly obliged*," and others conceive a line to "*appare oblique*" instead of "*appeering oblique*," the romanian spelling being *eu* and *i-e* in both cases. He that can explain these differences of speech, which the orthography completely disguises, has made a little progress in the study of the mutations of English. As to Mr. Trench's supposition that all barbarisms of pronunciation are to be written, it would not deserve notice if it did not show how eager even scholars are to write about what they do not understand. Ignorant people may and will write ignorantly, as at present, but printed books will, as at present, give what is believed to be the most generally esteemed pronunciation.

The present dictionary is itself an example of this. Here pronunciations are given which it is believed will be generally looked upon as good in America. They are based, in general, upon the works of the most approved American orthoepists. Books printed in this character will, then, in every word, show the reader how he should speak if he would follow the opinion of those who have paid most attention to the subject. There will be, and must be, differences of opinion on the subject, and for a while we may reckon on perhaps more than one word in sixty being pronounced, and therefore spelled, differently by different printers. But we already labor under this inconvenience in ordinary print and do not find it overwhelming. There is no standard of pronunciation, nor is it possible to create one. Those who have studied the subject are perfectly aware of the illusory character of all attempts to fix one way of speaking. Why is the pronunciation of Edinburgh, or Yorkshire, or Dublin considered incorrect? Why are Londonisms stigmatized? Why do the Americans consider their pronunciation better than the English, and the English their own pronunciation best? In what consists a good and in what a bad pronunciation? What is a *corruption*? What is an improvement? The most different opinions are entertained upon these subjects, and it is impossible here to enter upon them at length. Mr. Trench is particularly severe on the pronunciation of *Europe* as if it were spelled "*Urup*." [*U* being sounded as *u* in *union*, and *u* in the second syllable like the vowel in *but*. Some phoneticians prefer this pronunciation, while others prefer the brief sound of *o* in *propose*.] He

owns that perhaps numerically more persons in England pronounce in this manner, yet he would be "bold to affirm that if ninety-nine out of every hundred persons in England chose to call it *Urup* this would be a vulgarism still, against which the written word ought to maintain its protest, not sinking down to their level, but seeking to raise them to its own." Now *if* in phonetic books we spelled the word so as to pronounce the last syllable like *rope*, no doubt this spelling would prevail. It is etymologically certain, however, that this pronunciation is *incorrect*, being one of those which the old orthography has falsely conjured up. The word comes from the French to us, not from the Latin, as the accent shows, and the French *o* in an unaccented syllable should, according to the genius of our language, become the very sound which Mr. Trench reprobates.

Those, however, who rail at phonetic spelling as likely to produce the greatest variety of pronunciation have entirely mistaken its action, and show themselves totally unacquainted with the subject. The normal effect of phonetic spelling must be to produce and perpetuate great uniformity of language, and to settle a pronunciation upon some intelligible basis. Our first attempts, such as that made in the present work, must, of course, be considered as only first attempts, and rather as proofs of what phonetic spelling is suited to do than of what it will ultimately effect.

22. Objection on the Score of Etymology.

As the adoption of phonetic spelling is one of the most practically useful labors which could be undertaken, we must not be surprised to find it attracted the attention of the most practically minded men in the United States. Benjamin Franklin himself sketched out a scheme of phonetic spelling, and in the brief letter which he has left us on the subject, has, in a very few words, disposed of the objection which was sure to be raised against it on the score of etymology. "Etymologies," says he, "are at present very uncertain; but such as they are, the old books would still preserve them, and etymologists would there find them. Words, in the course of time, change their meanings, as well as their spellings and pronunciations, and we do not look to etymology for their present meanings. If I should call a man a knave and a villain, he would hardly be satisfied with my telling him that one of the words originally signified only a lad or servant, and the other an under ploughman, or the inhabitant of a village. It is by their present usage only that the meaning of words is to be determined."

But, although this argument is all-convincing to the practical man, the scholar, and especially the scholar who has been taught on the usual classical school and university system of instruction, would

not be satisfied with it. He would require other considerations, for to him the words in the present spelling do really convey a notion of their origin, or at any rate have every appearance of so doing. But how is it that the spelling informs him and does not inform a person who is ignorant of Latin and Greek? Nay, more, how is it that the words which are not derived from Latin and Greek sources, but from Anglo-Saxon, do not betray their origin to him at a glance? How is it that the mere Latin and Greek scholar is unable, from the orthography of the words in the Lord's Prayer, to tell the history, derivation, and meaning of more than two or three, as, *trespasser, tem, tation, deliver, glory*, and even here will most probably be in error, as he may be inclined to give to the Latin what belongs to the French? Does not this show him that the spelling *alone* does not give the required information, but only the spelling in connection with *much other learning*; and that those who acquire this learning will also seek out, not merely the present, but the still older form of the word, in short, all the historic traces of the word which they are able to discover, and that the greatest errors may be committed from a hasty conclusion drawn from a knowledge of one or two languages only, and the mere look of the word?

The present spelling, then, does *not* give the etymology or history of a word, and hence by changing the spelling we do *not* deprive persons of any etymological benefits. Etymologists will have the same use of the present and older spellings as they now have, and those who are unable to study etymology for themselves—and this is the greater part of mankind—will take the conclusions of etymologists as they now take them, with this additional advantage, that the etymological information will be accompanied with a phonetic explanation, showing how the original word came, by the laws of sound, to lose its old and gain its new form. True etymology will thus be brought to light, and distinguished from the false etymology of grammar. It will be found to deal with words themselves and not with their accidental orthographies.

No one, from the spelling alone, for example, could trace the slightest resemblance between an English, French, Latin, Greek, Sanscrit, Zend, or Hebrew word. The difference of alphabet effectually conceals the connection. It is not till they are all reduced to some uniform and consistent orthography that the connection becomes apparent, and then only after a phonetic study. Hence philologists are now content to admit with Chevalier Bunsen, that "the theory of etymology shows itself inseparable from that of phonology." (*Outlines of the Philosophy of Universal History*, vol. 2, p. 380; account of the Alphabetic Conference held at London in 1854.) It is only the half learned, then, or at any rate the half learned on this point, who fear

any injury to etymology from the adoption of phonetic spelling, which, on the contrary, will be found one of the most favorable circumstances which could ensue to the study of true comparative philology.

23. *Use and Abuse of Etymology.* There is, however, a false etymology which is much prevalent, and now much taught in schools. As the English is a language derived from many sources, and in modern times has received many accessions from the Latin and Greek direct, while previously it received them indirectly through the French, teachers have been much in the habit of showing the Latin and Greek roots to which words not Saxon may be traced, and considering these as the etymologies of the language. The grossest errors are most frequently committed in this respect, both in the actual history of words, and in the derivation of their meaning from the history. More accurate knowledge, founded upon phonology and the logical history of words, will correct these, but in the mean time it is necessary that people should be disabused of the thought that if they know the ultimate Latin or Greek origin of a word they know its meaning. Archbishop Whateley gives the three words *understanding, substance, hypostasis*, all identical in their radical meaning, and widely different in their actual applications as examples of the dangerous mistakes which may be made by those who go direct to the etymology of words. It is a most instructive and useful exercise to observe the alteration in the meaning of words, or to trace the derivation of the most varied ideas from the same radical notions, but any one who conceives that he could *predict* the change by knowing the original, would be like a man prognosticating the course of a river from a knowledge of the locality of its source without any conception of the nature of the country through which it had to flow.

Etymology is not only inseparable from phonology, but from history also; and the sooner that such bastard learning as commonly goes by the name of etymology is got rid of, the better for the logical education of Englishmen. To those who *know* Latin and Greek the changes made by phonetic spelling will not occasion the slightest difficulty in tracing a word to its origin; to those who *do not*, the changes are of no consequence whatever.

24. *A Real Objection to Immediate Change, and its Remedy.* There is, however, one real and very serious impediment in the way of a speedy introduction of a phonetic system of orthography, which has been generally overlooked; it consists in the great and prevailing ignorance of the science of phonology, the nature of speech sounds, their varieties, their analysis, and their

synthesis. It is rare to meet with a single elementary work which contains even a tolerably correct account of this important subject, and even scholars and professed teachers of pronunciation and elocution are generally very ignorant of the latter. Nay, more, the very teachers and best investigators of the subject are at variance. Let any one peruse the works of the greatest authority we possess, those of Amman, Johannes Müller, Willis, Wheatstone, Lepsius, Max. Müller, Latham, &c., and he will see differences on fundamental points which are irreconcilable. If he turn to works of minor pretence, as Bell, Smart, Walker, Worcester, and the numerous works on elocution, he will find confusion partly arising from ignorance, and partly from a partial view of the subject. While in common grammars, and in the common treatises of travelers, and pronouncing vocabularies and dictionaries, he will find that one person has copied from another without understanding him, till words are repeated and sense is entirely lost.

Now it is absolutely necessary that this confusion should, to a certain extent, be removed,—that speakers of the English language at large, wherever living, may be thoroughly acquainted with an approximately accurate phonetic analysis of their language and familiar with its use, before we can hope to find them sufficiently prepared to accept phonetic spelling, not merely as a scientific instrument, but as a practical working tool. And how is this result, this necessary preliminary, to be gained? By introducing a phonetic alphabet and the proper instructions in using it, into every school, so that the youngest children should become used to analyze words into their elementary sounds, and to combine the elementary sounds into words, and thus obtain a practical knowledge and feeling of the phonetic constitution of our language. But by what means can we effect this? By the very same means by which we propose to overcome the conservative objection arising from the existence of a previous unphonetic orthography—by making phonetic reading an introduction to romanian, on the ground that it is the practically best method of acquiring facility in ordinary reading. In this respect, then, also, a reading reform is a necessary antecedent to a spelling reform. To carry it out properly requires, first, the production of a number of books in phonetic spelling, and, therefore, for the guidance of printers and others, a phonetic dictionary such as the one which follows; and, secondly, the use of such books in schools and elsewhere for acquiring a knowledge of good speaking and of romanian reading. These efforts will be advanced, of course, by periodical publications in a phonetic character, such as the *Type of the Times* and *Phonetic Journal*, to show its applicability to every purpose for which the

ordinary spelling is used, and to many purposes for which ordinary romanian spelling has proved entirely inefficient. Hence it is absolutely necessary that the forms of the letters in the new phonetic alphabet should bear reference to those in the old romanian alphabet, so that similar sounds are generally represented by similar forms, as otherwise we could not hope that the phonetic orthography would prove a good introduction to romanian. For whatever language, then, the experiment of a spelling reform is to be made, the characters chosen for the new alphabet must be based upon the forms and significations of the letters there already used. (See below, §44.) Such an alphabet is the one used in this Dictionary, of which the following is a brief history.

25. History of the American Phonetic Alphabet. It is seldom that the full bearing of any great invention or discovery is seen at first. We often work for the pursuit of some impracticable object, and meet with a practical result by the way. The difference between the visionary and the truly practical mind is shown by the power which the latter possesses to seize what is real and attainable, and leave what is beyond its powers.

The origin of the phonetic alphabet was entirely practical: it was then worked out as a theory, intended to embrace all languages, and the forms of the letters were chosen with reference to their phonetic relations and their relations to the Latin; but only by slow degrees did its inventors discover that the English romanian alphabet, both as to the forms and powers of the letters, must be taken as the basis of a spelling reform for the English language, in order to familiarize the people with the notion of phonetic spelling, and enable them at some future period to form an alphabet for themselves upon truer and more cosmopolitan principles.

Isaac Pitman, of Bath, Eng., is known as the inventor of a beautiful system of shorthand, called Phonography because based on a phonetic analysis of our language. He has given, himself, the following account of its origin:—

“When I was about 17 years of age, I had read most of our standard English authors, and had a tolerable acquaintance with the language as it existed in books, but I had not enjoyed the opportunity of hearing it *spoken*. The language of everyday life consisted of but few words, and at the pronunciation of all the rest I was obliged to *guess*, or turn them out in a pronouncing dictionary. I thought it would be less trouble to read the dictionary through, and copy out the words that I was accustomed mentally to mispronounce; for I had, of course, some idea of the sounds of the letters and the position of the accent in each word. I saw, too, that by this plan I should secure other

words that I had not happened to meet with in the course of my reading. When my task was finished, I had a list of two or three thousand words that I had not simply to learn the pronunciation of—this would have been an easy task—but I had to unlearn the false mode in which I had been used to utter them to myself while reading. I must account for my extreme ignorance in this respect, by observing, that I had enjoyed only the education of a National school, from which I was taken, I think, at about the age of 12, and became clerk in the establishment of a clothier in the west of England, where my father was manager. These columns of words I read over and over again, both tacitly and aloud, until I was well acquainted with them. About a year afterwards, I commenced the practice of shorthand, and have continued it to the present time, a period of fifteen years. I read through *Walker* again for the same purpose, about four years after, and particularly studied the 'Principles of English Pronunciation' prefixed to the Dictionary, and the 'Key to the Pronunciation of Classical and Scripture Proper Names.' Both of these parts of the book I read several times. This perusal of *Walker* I must consider as the commencement of my phonographic career, though the name of 'phonography' was not thought of till many years after. By this means I obtained some acquaintance with the alphabet of the spoken language."—*Speech at Lisle, May 14, 1845.*

Few have the patient industry of Isaac Pitman, as evinced in this perusal of *Walker's* Dictionary, this extracting of mispronounced words, and their careful study; and *none should be forced* to acquire a knowledge of their own language by such painful processes. It is unjust to waste their time and intellectual strength over such letter-grubbing, when we have the power to exhibit the proper sound of each word at a glance. But if a talented youth like Isaac Pitman, who had already read the works of our best authors, was obliged to make himself acquainted with the sounds of the words he had so frequently seen, by a process so laborious, because circumstances did not throw him into the way of persons who spoke these words, what must be the state of those many thousands, who without his talent and perseverance, and with no more opportunities of learning words than he had, pore over the hieroglyphics of our written language.

His shorthand was first published in 1837. In May, 1842, the success of Phonography encouraged him to predict that "Phonography must soon supersede all other systems of shorthand, and then become the common medium of written communications, and, lastly, change the printed character of the millions that speak the English language." This must be taken as the first announcement of the present phonetic movement as distinguished from others on a smaller scale.

C

With his usual practical forethought, Mr. Pitman immediately started the question, "Whether entirely new forms, or modifications of the Roman forms should be used," for the letters of the printing alphabet. In the course of 1842, several different schemes on very different principles, as regarded the forms, but all founded on the phonetic analysis of Phonography, were published in the *Phonographic Journal*. Next year 1843, half a sheet of letter-press was added to the *Phonographic Journal*, for the purpose of pleading for a change in the printing character. This additional matter was called the *Phonotypic Journal*, which title, as Mr. Pitman observes on the first page, was "chosen prospectively. We have reason to hope," he adds, "that the time is not very distant when it will be printed in Phonotypes." The result of the exertions made in 1843, was, that sufficient funds were collected for providing a fount of Phonetic types, or Phonotypes, and specimens of Phonetic Printing were given in the enlarged *Phonotypic Journal* for 1844. In January, 1846, the whole *Journal* was printed in Phonotypes, and from this time the experiment of Phonetic printing became more and more practical, till the alphabet was reduced to a satisfactory working state in January, 1847. So many persons have taken part in bringing the alphabet to its present state of perfection, that it is impossible to name any one as the sole inventor. To Mr. Isaac Pitman, of Bath, unquestionably belongs the merit of the idea, and of the practical form in which the Phonetic system of spelling was so cleverly clothed, even in the editions of his system of Phonography, the success of which alone could have paved the way for the introduction of Phonetic Printing. The first form of the Phonetic Printing Alphabet, and the determination to use a variation of the Roman alphabet, are also entirely his; but most of the letters were invented, and the theory of their use laid down in conjunction with the author of this introduction who had occupied himself with Phonetic investigations and attempts at forming a universal alphabet, for several years before he had heard of Mr. Pitman's labors on the same ground, and who has taken an active part in all the experiments and investigations made since August, 1843, when accident first made him acquainted with Phonography. He eventually became the chief proposer of further experiments, and starter of theories on which to found them, while Mr. Pitman, with unparalleled industry and perseverance, and practical tact, worked them out, and was mainly instrumental in bringing their merits to the test of experience.

The alphabet thus completed in 1847 was vigorously used. In 1848 many books were printed in England, and in 1849 the *Phonetic News* was started by Mr. Ellis. The great expenses attendant upon its publication, and ill health arising

from over-exertion, brought this publication to an early close; but phonetic printing was continued by Mr. Pitman, who, in addition to the New Testament which had been already published by Mr. Ellis, printed the whole Bible phonetically. In December, 1845, when it was imagined that the labors of the Messrs. Pitman & Ellis were brought to a conclusion, Messrs. Andrews & Boyle, of Boston, started a newspaper in the phonetic character, which, under the name of the *Anglo-Saxon*, was published for about a year and a half. After the 1847 alphabet was completed, Mr. Elias Longley, of Cincinnati, in order that the Americans might be aware of the progress which was made, commenced the *Phonetic Magazine*, in July, 1848, now published under the title of the *Type of the Times*, partly in phonotypy. In 1851 Mr. Pitman began to feel dissatisfied with some of the letters in the alphabet, and commenced a series of new experiments, in which Mr. Ellis did not take part. The result of these experiments is not yet known, as in August, 1855, they were still going on. In the meantime other experiments were made in America, where it was found advisable to introduce a few more vowel characters, and in consequence some three or four changes were made in the 1847 alphabet, which is still used by the *Reading Reform Association*, in England, as an introduction to romanized reading on the Reading Reform principles. In 1854 Messrs. Longleys & Mr. Benn Pitman formed themselves into a Phonetic Publishing Association, and pledged themselves to use the alphabet for ten years without further alteration. In this alphabet, therefore, the following Dictionary is composed,—the expenses of publication having been defrayed by a legacy left by Mr. Nathaniel Storrs, of Boston, Massachusetts, for the purpose of its publication, a noble instance of zeal in a good cause.

26. Transitional Nature of this Alphabet.

Such is the brief history of this phonetic alphabet, which is thus shown to be the work of many minds and many hands laboring for years and practically experimenting with letter types. As may be expected, the results are superior to any which have hitherto been produced. It is most probable, however, that a future generation, thoroughly familiar with the use of phonetic symbols from childhood, and not bound down by the same roman prejudices which blind our own eyes, will find reason to effect further changes: and should several nations unite in having a uniform phonetic orthography, which is much to be wished, it will become necessary to change its basis altogether, and most probably to substitute a Latin for the English principle on which its forms are now constructed. Any attempt to reconcile the present various uses of the Roman letters by the nations

of Europe is, of course, visionary and impracticable. When English speakers are once accustomed to phonetic reading in the present symbols, such a change, which would only involve a few of the letters, would occasion no inconvenience at all to the reader. The changes which have been made have already shown spelling reformers that there is no difficulty in reading in two or three different phonetic alphabets when facility in reading one has been attained.

It remains very briefly to point out the phonetic principles on which this alphabet has been constructed. The chief difficulties in this explanation arise from its partial nature, as it is an alphabet of the English language only. To remedy this a few foreign sounds will be introduced and provided with characters, chiefly digraphs, which being printed in small capitals will be readily distinguished from the rest. The order of the explanation will not be the same as that of the alphabet which has been dictated by other practical considerations to be mentioned hereafter. (See below, § 43.)

27. Nature of Speech, and its principal Divisions.

Speech consists of a series of sounds heard by the listener, and produced by the speaker by means of the organs of speech. These organs are, first, the lungs, which act as bellows; secondly, a tube from the lungs, termed the *trachea*, or windpipe, and having at its termination a box of cartilage traversed by two highly elastic bands, (the vocal ligaments,) which, by means of muscles, may be brought into various positions, and stretched with various degrees of tension; thirdly, two terminating orifices—the mouth and the nose. The mouth consists of a vaulted chamber, terminated by a sharp wall, the teeth, and the flexible lips, while its interior can be altered in a great variety of ways by the protean tongue. The nose consists of several passages leading to the face from the pharynx, which forms a hollow bag at the back of the mouth above the gullet and windpipe. The back entrance consists of two openings, called the back nostrils, which are closable by means of certain muscles, called the soft palate, a prolongation of which, termed the *uvula*, is well seen as a little tongue at the back of the mouth when opened. In speaking, breath is *expelled* from the lungs through the larynx, and then through the mouth or nose, or both mouth and nose. In passing through the larynx it may leave the vocal ligaments unmoved, and in this case the sound is termed *whisper*; or it may make them vibrate, and the result is *voice*. The effect of both voice and whisper may be greatly modified by the passage through the mouth or nose. When the passage is so arranged that the voice can pass clearly and sonorously, the result is called a *vowel*, which is

whispered when the whisper, and not the voice, is emitted through the same position. If some obstruction is placed in the way, the voice becomes less clear, and we have in succession *trills*, *murmurs*, *buzzes*, and *sonants*, to all of which, except the last, whispered forms or hisses correspond; the last, however, give rise to positions which entirely check the voice, producing *mutes*. If the voice or whisper pass through the nose, we have *nasals* or *kums*, which are distinguished by more or less resonance in the mouth; and if the sound is allowed to pass through both mouth and nose, we have *orinassals*. The term *consonant* is a general word which includes all the sounds except vowels and orinassals.

28. Vowels---Upper Series. The sound produced by the vibration of the vocal ligaments, when least of all modified, is the sound of *u* in *up*, which we represent by U u, and which is rare in other European languages. If the tongue be slightly raised, a clearer, brighter sound is produced, viz., *a* in *father*, *psalm*, *bath*, *arm*, which is in this alphabet represented by A a. It is the true Italian *a*, and is finer than the French *â* or the usual German sound of *a*. This sound is in many words pronounced short, in America, (and as some orthoepists consider in England also,) as in the words *ask*, *east*, and is then represented by O a. Some English writers have asserted that this is a new vowel altogether, and in London and the south of England it is generally pronounced as the long *q*. Raising the tongue still higher, we come to a vowel quite peculiar to English, *a* in *am*, *hand*, *hap*, *glad*, *sat*, *match*, *have*, *gas*, which is here represented by A a, and does not occur long except in the west of England and Ireland as a provincialism. All these sounds, q a a, partake of one uniform character, which forms them into a natural group corresponding to the Latin *a*.

The next three vowels also form a group corresponding to the Latin *e*. The first is very common as a short sound in *ell*, *men*, *head*, and is represented by E e. The second is the lengthened sound of the same vowel, which is only heard before *r* in English, as in *air*, *fair*, *pear*, *hair*, *ne'er*, *there*, and is represented by A e. In German and French it often occurs before other letters, as (G.) *geben*, *leben*; (F.) *bête*, *faite*. The third sound is much finer, as in *ale*, *ape*, *vein*, *danger*, and is represented by U e.

The next two vowels form a group corresponding to the Latin *i*. The first, the *i* in *ivy*, is almost peculiar to English, where it always occurs short, and is here represented by I i. The second is the true Latin, German, Italian, and French *i*, which is generally long in English, as in *machine*, *ween*, *meat*, *heap*, etc.; but sometimes short, as in *remove*, *evolve*, etc. It is represented by E e.

The eight vowels just described, q, a, a, q, e, a, i, e, form a series in all of which the tongue is raised so as to project the breath against the hard palate, while the tongue is lowest for q and highest for e. These are termed, therefore, the *upper vowels*.

29. Vowels---Lower Series. Beginning again with u, and lowering the tongue considerably, we come to a vowel which is not found in Latin, although its representative may be traced in Italian, and also in Swedish and Danish. When long it is represented by a in *all*, *aw* in *awl*, *o* in *more*; and when short by o in *on*. The long sound is represented by O o, and the short by O o. This vowel forms, with q, a, a, and u, the so called *guttural* group, while the remaining upper vowels, q, e, a, i, e, are separated as *palatal*.

If the lips be now somewhat closed, we have an obscure labial vowel, corresponding to the Latin *o*, and Greek *œ*. When long it is *o* in *hole*, *oil* in *oak*, etc., and when short it is *o* in *omit*, and *oe* in *windoe*. In some parts of the United States it is found short in closed syllables, but this is not general enough to necessitate the employment of two signs, and hence it is always represented by O o.

The next labial vowel, the Latin *u*, occurs as a long vowel in *pudd*, *ooze*, *wood*, and short in *pull*, *wood*, *cook*, etc. The long sound is represented by O u, and the short by U u. The vowels O o U u form the *labial* group. The group o o, O o, O u, forms the *lower* series of vowels.

30. Vowels---The Middle Series. In French and German, and some other languages, there is a middle series of vowels, arising from an attempt to pronounce an upper and lower vowel *simultaneously*; thus (G.) *über*, *kütte*, (F.) *vue*, *flûte*, is due to an attempt to pronounce o and e at the same time. We will represent it by œ œ, in accordance with a German custom. Again, the (G.) *büse*, (F.) *deux*, is obtained by endeavoring to pronounce o and u simultaneously, and may be represented by œ œ. The English u properly belongs to this series and bears about the same relation to q o as œ does to o r, and œ œ to o n.

31. Complete Vowel Scheme. The following arrangement, therefore, will show all the relations of the vowels here considered:

Guttural.				Palatal.	
Upper.	q a, a	q e, a	i, r.	Palatal.	
Middle.	u —	—	œ œ —	œ œ —	Labio-palatal.
Lower.	o o, —	—	o —	o u, Labial.	

32. French Orinassal Vowels. During the pronunciation of any one of these vowels, which are naturally pronounced solely through the mouth, the back nostrils may be opened and the veil of

the palate so disposed as to admit of a vibration producing nasalization. If we represent this by ñ, the four signs qñ or oñ, eñ or añ, oñ, uñ will very tolerably represent the French orinasal vowels in *an, rin, on, un*, in which the voice proceeds from oth mouth and nose at the same time. There re evidently as many orinasal vowels as there re oral vowels, and they are found in the Indian languages.

33. Consonants---The Guttural Series.

There are three principal positions of the mouth where the passage of voice may be obstructed,—near the soft palate, on the hard palate, and at the lips. This gives rise to three series of consonants known generally as *guttural, palatal, and labial*. Taking the case in which the contact is most complete between the approaching portions of the mouth, and going through this series in order, we have, first, the *mute* K k in *back, art*, etc., formed by a contact between the root of the tongue and the soft palate, and preventing all passage of air. When the parts are opened out, a slight whisper is heard which is termed the *power* of the letter. If the sides of that part of the mouth which lies behind the tongue in this position be so far relaxed as to allow more air to be driven in and condensed, then if vocal breath be forced up, a slight sound will be heard for a very short time, until the condensation of the air reaches its maximum, and then silence must ensue, unless there be a relaxation of the contact itself. The sound thus produced is the *sonant* G g in *beg, get*. The mute and sonant together form a group known as *guttural exponents*, because the contact is so firm that if we first endeavor to form the vowel and then relax the contact, the sound issues from the mouth with a sort of explosion.

Relaxing the contact considerably, and forcing through it mere whisper, we produce a guttural hiss, *kh* in the German *ach, cloch*, which is very common in many languages. If the contact be loosened to the extent of the following vowel, and some whisper allowed to escape before the vowel, this becomes the aspirate H h in *hat, hand*; but if the tongue be forced up very high, a much more acute guttural is heard, *ch* as in the German *ich, echt, durch*, and this approximates very closely to the sound heard at the beginning of the English word *hue* hyq, or huq, as it will be found in this Dictionary, to suit the general opinion upon the subject. This *hy* is slightly more hissing than the whisper of the vowel *e*, while *ch* seems to correspond to *e*, and *kh* to *q*; *h* being common to all the vowels. Each of these hisses admits of a *buzz*, which appears to be occasioned by forcing the voice so strongly through the larynx that it is only partially vocalized, and thus voice and whisper are heard in a mixed form. Thus *kh* gets *gh* in German *Tug; ch* becomes *gh* in

German *eigen, künige, and hy* becomes *gy* in *ye, yield, yet, yacht*, a sound so slightly removed from the vowel *e* as to be often confounded with it.

It may be remarked that in many languages *ε* is really pronounced, and not *y*, as the letter is nearly peculiar in European languages to the German stock, including the English. The contact is *closer* than for *ε*, and the sound is a *buzz* and not a clear voice. The aspirate *h* may be said to admit of the *buzz* in the soft breathing which the Greek and Semitic languages have thought necessary to mark.

The hisses and buzzes are collectively termed *continuants*, because their sound can be continued indefinitely.

In saying *kh* the *uvula* lies upon the root of the tongue. If the breath is forced so as to make the *uvula* trill, a guttural sound is produced, which, when very harsh, is the Arabic *gh* in *ghain*, but when very soft indeed, scarcely perceptible, is the English *Er* *er* in *err, earn, fir, first*, etc. This sound is represented by a double sign in this alphabet, its first letter being reckoned as a vowel for practical reasons; the real nature of the sound is what is just stated. In England, and in the 1847 alphabet, it was represented by *er* or *ur* indifferently, according as the romanian spelling seemed to indicate a more palatal or more guttural pronunciation, and this plan is still pursued in the unaccented syllables in this book, *er* being reserved for the accented syllables. When the letter does not form a syllable by itself the *e* is omitted; thus we write *qr, mer*, although both words really contain this guttural.

If, instead of loosening the contact between the tongue and soft palate, the back nostrils be opened and the voice allowed to escape there, and also to resound in the small portion of the cavity of the mouth left behind the tongue, the nasal IJ *y* is formed, as in *hang, strength, strong*. These syllables must be carefully distinguished from the French orinassals in which the passage through the mouth is completely unobstructed. The *trills* and *nasals* are often collectively termed *liquids*. This concludes the series which has now risen from mutes to an approximation with oral vowels through *er*, and nasal vowels through *y*.

34. Consonants---The Palatal Series.

It may now be readily understood, without going into so minute explanations, that T t, the t in *toe, sit, better*, is a palatal mute, and D d in *doe* its corresponding sonant. The true corresponding hiss is S s in *seal*, and the buzz Z z in *zeal*. If in making these sounds the back part of the tongue be depressed, a hollow, obscure sound results, giving the hiss X x in *shall, vicious*, and the buzz G g in *azure, vision*, (Fr. *je*.) But if the tongue be brought close to the teeth and either put between them, or pressed with its under surface against

them, the result is a pair of lips, the hiss *h* in *thin*, *three*, *path*, modern Greek *θ*, and the buzz *u* in *then*, *there*, *within*, modern Greek *δ*. Proceeding to the trills we find they divide into two. Either the tip of the tongue still adheres to the palate and the breath escapes on each side of the tongue, giving rise to the hiss in the Welsh *Llan-gollen*, (often falsely mispronounced *llangöllen*, by Englishmen, its real sound being better represented by *llangöhlen*;) and the *murmur* *l* in *low*, which forms a distinct syllable in *little*; or else the tip of the tongue is so relaxed that the passing breath causes it to trill, producing *l* in *ray*, *very*; which is in this practical alphabet confounded in orthography with the *er*, when the letter does not constitute a distinct syllable. The true sounds of *ray*, *rare*, *very*, *rarer*, would be more truly represented by *ra*, *rqr*, *veri*, *rqrqr*, for which, for practical reasons, *ra*, *rqr*, *veri*, *rqrqr*, are here used. The corresponding nasal is *N* in *sin*, which forms a distinct syllable in *open*.

35. Consonants---The Labial Series. In the labial series we have first the mute *P* in *pole*, and its sonant *B* in *bowl*. Next, by relaxing the contact of the lips, but *not allowing the lower lip to touch the teeth*, we have as a hiss the true Greek *φ*, or *ph*, and as a buzz the true German *w*, or *bh*; while if the lower lip touches the teeth the hiss *F* in *fear*, and the buzz *V* in *veer*, are produced. Again, if the lips are rounded instead of being flattened we have the hiss *H* in *what*, *wheel*, and the buzz *W* in *teet*, *weal*, sounds often confounded with each other and with the vowel *u*, from which they differ as shown by the words *weal*, *weal*, in the greater compression of the lips and the buzzing sound. The corresponding nasal is *M* in *me*, which forms a complete syllable in *schism*, *chasm*, *spasm*, *rhythm*, and is very vocal indeed, the whole oral cavity resounding with the nasal, so that whole airs can be *hummed*.

36. Complete Consonant Scheme. The above considerations will lead us, therefore, to arrange the consonants thus, beginning now with the most vocal as nearest to the vowels.

	Guttural.	Palatal.	Labial.
Explosive, Continente, Liquide.	{ Hums. — u —	— u —	— m —
	{ Trills. — er —	— r —	— — —

	{ Mutes. — k — —	— t —	— p —

Which, without pretending to completeness, is sufficient to give a true notion of the position of English sounds in a universal alphabet. It will be seen that the order is widely different from that in the practical alphabet, the reasons of which will be presently explained, but it is first necessary to speak of the peculiar effect of combining the elementary sounds which we have now recognized.

37. Combined Sounds---The Glide. In all the previous sounds the parts of the mouth remain immovable, or only vibrate during speech. When, however, we join one elementary sound to another, we make no pause between, but pass rapidly on. In doing so, therefore, we emit voice or whisper through the vocal organs while the position of the organs of speech is changing from the first to the second. Hence a new sound, or rather a series of sounds, is developed, passing insensibly into one another, commencing with the first and ending with the second, exactly similar to the series of sounds produced by sliding the finger down a violin string while the bow is drawn. This is the *glide* which connects sounds together, and is symbolized by the simple apposition of the characters. Thus, in *op* we hear first *o*, and next the glide due to the passage of the voice through the variable opening made in passing from *o* to *p*. If we simply close our lips at *p*, and do not open them again to emit the slight whisper which makes *p* distinct, this glide is the whole effect of *p*, and hence we have the apparent contradiction solved of one of the elementary sounds being *mute*. The true sound or effect of the mute letter is the glide upon the preceding or following vowel or whisper. In the Canton dialect of Chinese many words end in *p* and *k* without any whisper following, so that *p* and *k* actually have *only* their gliding effect on the preceding vowel, and are hence very slightly audible, but the speaker perceives them very readily. In such words as *a-tog*, *up-torn*, the English *k* and *p* have also only this gliding effect, as well as in *act*, *skip*, *ed*, *akt*, *skipt*, although in these words the final *t* receives the whisper. The action of the glide is very important, and it is necessary to specify a few cases.

38. Combined Sounds---Vowel Diphthongs. If the two terminal sounds are vowels and one of them is of brief duration, the glide connects them into a *diphthong*. This is the true explanation of the nature of diphthongs as distinguished from vowels of the middle series. A diphthong, then, is two vowels with a glide between. It is necessary that one of the vowels should be short, as otherwise the effect of two *syllables* is produced, see § 11. The diphthongs *ai*, *ui*, *au*, *ua*, may thus be formed, making the first element very brief. The first two are some of the various

pronunciations of *igh* in *high*, and the second two of *ow* in *how*, and as opinions differ greatly as to what the first element of these diphthongs *ought* to be, it has been found advisable, for the sake of uniformity and ease in teaching to read, to represent them by the single signs *f* j and *S* s respectively. Of the third common English diphthong *oi*, the only doubt is whether the first element is long or short. Indeed, it varies in different words. Hence, and for the sake of having the three principal diphthongs represented in a like manner, this is also furnished with the single sign *O* o. In all these diphthongs the first element is guttural, and the second palatal or labial. But either palatal or labial element may be prefixed. The sounds *iq*, *ia*, etc., *uq*, *ua*, etc., are, however, very rare in the beginning of words in the mouths of English speakers, who find it most convenient to sink them into *yq*, *ya*, etc., *wq*, *wa*, etc. But in France and Italy they may be distinctly heard. It is necessary to distinguish the sounds, [Fr.] *oui* (heard,) *oui* (yes,) [Eng.] *we*, [G.] *wie* (how,) [Fr.] *vie* (life,) which may be written thus, *u,ε*, *uε*, *wε*, *bhe*, *ve*. In *u,ε* two vowels are heard distinctly and *without* a glide: in *uε* there are two vowels *with* a glide; in *wε* the first vowel is degenerated into *w*, a buzz, which is pronounced with rounded lips; in *bhe* the lips are flattened, but the lower lip does not yet touch the upper teeth; in *ve* the change is complete, and the lower lip touches the teeth.

The diphthong *uε* is peculiar in having an extreme labial followed by the extreme palatal; in *εu* the case is reversed, and the changes made, first, the prefix of *y*, thus, *yεu*, and secondly the loss of *ε*, as *yu*. The combination is also changed in another direction, for the glide is lost and *ε* and *u* are pronounced simultaneously, giving rise to *ue* with more or less prevalence of the *ε* or *u* element. To avoid the trouble which beginners in phonetics must always feel in distinguishing accurately between *εu*, *yεu*, *yu*, and *yū*, all four cases are fused in the English form of the phonetic alphabet under one letter *U* u, while in American use *u* represents *εu*, (in some parts of America more nearly *ue*.) and *u*, *yū*, *yō*, are distinguished as in this Dictionary.

39. Combined Sounds---Consonant Diphthongs,---Double Consonants. In the same way as vowel diphthongs occur we may have consonant diphthongs, either between voice or whispered consonants, or between a mute followed by a whisper. The last case is the most characteristic, and the connection is so close in some cases that almost all nations have indicated it by using single signs for the consonants; thus the Greeks used *χ*, *ξ* for *ps*, *ks*,—the Germans and Italians use *z* for *ts*,—the Italians use *c*, *g* before palatal, and *ci*, *gi* before other vowels for *tj*, *dj*. As these last two

diphthongs are common in English they are represented in the phonetic alphabet by simple characters *C* c, *J* j. When these *follow* a vowel there is, of course, a glide up to them, which is lost when they only precede a vowel; hence in the latter case the presence of the *t* and *d* is more felt than in the former. Some persons are, therefore, apt to write 'matj' for *mag*, and 'judj' for *juj*, on the same principle that in romanian spelling the consonant is doubled in *matting*, *adding*. This is not the case in speaking; but in *do*, *d* has only one glide, in *adding* it has two glides. Sometimes these glides are separated by a distinct pause, as in *bootree*, *headdress*; compare also *souppan*, *bookcase*, *piggoad*, *halffinished*, *missent*, *fishshop*, *soulless*, *meanness*, in all of which there is a real pause between the consonants. Here, then, we must double the consonant in writing, but not otherwise; thus, *bōttrē*, *hēddres*, *sōppan*, *būkkas*, *piggod*, *hāffinift*, *missent*, *fiffop*, *sōlles*, *mēnnes*. Sometimes *t* and *j* occur *without* a glide between them, as in *abbotship*, in which case *tj* and not *q* must be used, as *ābotfip*, not *ābogip*.

40. Combined Sounds---Stopped Vowels.

In all cases where the first element is very short, the glide is more heard than the initial sound, and some obscurity is apt to arise, which often changes the character of the vowel. Thus when a short vowel is annexed to a consonant, we seldom find that it precisely corresponds to the long vowel from which it was apparently derived. Thus Englishmen instead of saying *et* with short *ε*, say *it*, in which the vowel is depressed. These vowels whose career is suddenly stopped short by the glide of a consonant are called *stopped vowels*, and they are found to occur in Chinese without a consonant after them, or only with a check of the voice, which may be imitated by the flip of a towel or crack of a whip. When not so cut short they may be termed *brief*, the short being a general term which includes both. Thus in *pity*, *piti*, the first *i* is stopped and the second *brief*. The words *knit*, *net*, *gnat*, *not*, *nut*, *pull*, contain all the stopped vowels.

41. Combined Sounds---Syllables.

In gliding from sound to sound we meet with interruptions in the mutes; the voice is interrupted by the hiss; speech is thus broken up into portions known as *syllables*. If we examine more minutely we shall find that whenever the organs of speech pass through a minimum opening, (that is one which is smaller than *both* those which immediately precede and follow it,) there is a decided separation perceptible. Hence we define as the boundary of a syllable, a silence, a hiss, or a minimum opening. We also find that if two *long* vowels follow each other, each of their sounds is so much longer than the glide which unites them, that they each form a

separate division or syllable. A syllable, therefore, generally ends at the end of a closing glide and begins at the beginning of an opening glide, meaning by this, glides in which the mouth closes and opens respectively. Thus in *happy*, *hap*i, the first syllable ends with the closing glide from *a* to *p*, and the second begins with the opening glide of *p* to *i*; hence in romanian spelling the syllables are divided thus, *hap-py*. In phonetic spelling we generally put the mark of division *after* the minimum opening if the preceding vowel is short, and before it if it is long. It is obviously only a matter of convenience, and may be changed at the option of the printer when the real fact is known. In syllabizing we must really say *hap-pi*, make a pause between the closing and opening glide, but not insert any whisper as at the end of the word *hap*.

42. Combined Sounds---Accent. In English some one syllable in every word is distinguished from the rest by a greater distinctness and loudness of pronunciation, so that when we are at a distance we hear these syllables *only*. These are termed the accented syllables, and, of course, although the *whole syllable* is accented, the loudest and distinctest part is in the maximum opening, or vowel, and hence the mark of accent is most naturally placed over the vowel. In the case of the stopped vowel, however, although this is still true, yet the extreme brevity of the sound causes the following glide to receive much of the stress, and hence we find some orthoepists stating that when the vowel is long the accent falls upon it, and when the vowel is short the accent falls upon the following consonant, and they would therefore accent *br'pɪp*, *hap'i*. This is an error which may be traced to the inconsistencies of romanian spelling,

which forms a very natural succession. Then the short vowels were arranged in the same order; but here a difficulty occurred in *u*, which belongs to the middle series. It was finally determined to arrange it immediately after the other guttural vowels, so that the order became *i, e, a, ɔ, o, u, ʊ*; by this means *u, ʊ* correspond to *o, ɔ*, and it is found that historically *u* frequently replaces the stopped *o*, which is lost in English.

The diphthongs naturally followed, first those with the closing glide, *i, e, ɔ*, then those with the opening glide, of which, however, only one was given, namely, *u*; in the others *y, w* were written for the first element at the beginning of words as a matter of practical convenience, and hence *y* and *w* were put next, as the representatives of the greater number of diphthongs with an opening glide, under the name of consonants, already the form under which *i, u, e, ɔ* close with the succeeding vowel. The English language possessing no guttural *l*ises with which *h* could be compared, it was placed between the vowels and consonants as leading from one to the other.

In the consonants the explosives, as being the most complete and having the most marked form, were placed first, and were arranged from the lips to the throat, *p, b, t, d, k, g*, while the two consonant diphthongs *q, j* were inserted after their first elements *t, d*. The continuants, divested of *y, w, l*, now followed in the same order, then the trill and murmur, and finally the nasal consonants, in the proper order from lips to throat. These considerations lead, then, to the following arrangement of the

American Phonetic Alphabet.

43. Order of the Letters in the American Phonetic Alphabet. As it is impossible to enter fully into the subject of phonetics in this introduction, the above may suffice as an explanation of the principles on which the alphabet is constructed. The order of the letters must next be considered. It is obvious that even if the inventors of the alphabet had been at the time in possession of the systematic explanation which has now been given, it would not have been advisable to arrange the letters of the alphabet in the order which a consideration of other languages besides the English has shown to be correct. Hence the alphabet required a thoroughly English arrangement. For this purpose the long vowels were arranged in a single series, commenced with the palatal, proceeding to the guttural, and ending with the labial, thus, *e, a, ɔ, ɔ, o, u*, and when the Americans introduced *q* and *j* they considered it best to place the first immediately before and the second immediately after *a*, so that the series became *e, y, a, ɔ, q, ɔ, o, u*,

44. *Forms of the Letters in the American Phonetic Alphabet.* An Anglo-romanian basis being chosen for the forms of the letters, i, e, a, o, u, represent sounds most usually represented in romanics by *i, e, a, o, u*, respectively, and *u* is formed from *u*, because it is not unfrequently represented by *u*, as in *pull, full, put, push*, etc. For the long vowels and diphthongs it was necessary to choose varieties of the single letters or combinations most frequently employed in romanics: thus *e* is a variety of *e*, being an *e* nicked in the back; *ɛ* is an underdotted *e*; *a* and *q* are simple varieties of *a*, and *q* of *a*; *o* and *ω* are varieties of *o*, one having a bar through it and the other being nicked at the bottom; the latter, too, is the Greek *ω*; *ω* is *ou* joined. The letter *j* is *i* with a tail; *σ* is *oi*, the dot of the *i* only being written, and the stroke of the *o* being prolonged to touch it; *ɿ* was meant for *u* on the top of *o*, as *ou* is one of its most frequent romanian representatives,—it is the Greek *ς*; and *η* is but *u* with a tail.

Of the new consonants, *q* is a variety of *e*, as the sound is most usually represented in romanics by *ch*. Similarly *f, g, y* are obvious varieties of *s, z, n*. The letters *t* and *d* offered the chief difficulties. In the 1847 alphabet they are printed *t̃* and *d̃*, which were meant to be varieties of *t* and *d*, inasmuch as *t* was usually represented by *th*, and *d* bears the same relation to *d* in sound as *t̃* to *t*; and *t̃* was also meant to be the Greek *θ* turned round and romanized. In America it was thought that if the fine side stroke were prolonged upwards, *t̃* being thus changed into *t̃*, it would resemble both *t* and the Greek *θ*, and thus suggest its sound to those who know Greek, while *d̃* seemed to bear to *d* the same relation as *t̃* to *t*, and to be also a variety of *θ*. The Anglo-Saxon forms for these letters are *þ* and *ð*, which are used in Anglo-Saxon books, but were not found suitable. As to the other letters the only doubt was whether *k* or *c* should be used. In the 1847 alphabet *c* is employed, because the sound of *k* is represented much more frequently by *c* than *k* in romanics; on the other hand romanian *c* is often sounded as *s*, while romanian *k* never is anything but *k* or *mute*, and this consideration prevailed in America.

45. *Importance of Understanding the Theory of the Phonetic System of Teaching Romanic Reading.* Such, then, is the alphabet which is presented to the American public as a practical working alphabet of the English language, fitted to introduce a final general complete phonetic alphabet, by instructing the nations who speak English in the phonetic analysis of their language. The present work shows the ease with which it can be applied to every word in the language, the precision of sound which it indicates,

and the uniformity of pronunciation which it is calculated to produce. The mode in which instruction is to be conveyed in schools can only be fully explained in conjunction with the proper books and apparatus, but it is of importance that the general scientific principles which are involved in teaching to read, first phonetically and then romanically by means of this phonetic system, should be briefly stated, in order that the reader should be fully in possession of the mode to be pursued for overcoming the only two real difficulties in the way of a spelling reform, namely, the existence of an unphonetic orthography and the general ignorance of the science of phonetics.

As has been already intimated, these two objects must be removed by making phonetic reading an introduction to romanian, and thereby giving all schools an *immediate* and not a *contingent* advantage in its adoption. The adoption must necessarily be partial, and it must only be recommended as the best means of teaching to read romanically. This it really is, hence those who recommend this mode of teaching to read are *bonâ fide* endeavoring to improve the *present* system of teaching to read, while they are enlightening the world as to the true principles on which an orthography should be constructed, so that they may reasonably hope that in one or two generations some such system will be universally adopted: although not necessarily, not even probably the same as is used for the special purpose of its introduction. Hence the great importance of thoroughly understanding the principles of the *reading reform, or method of teaching to read in the ordinary print by means of a previous course of phonetic reading*, which is frequently called by teachers the *phonetic system of teaching to read in the ordinary print*, or more briefly the *phonetic system*. The following is a very brief account of its theory as deduced from more than seven years' observation of its practice.

46. *Fundamental Principles of the Phonetic System of Teaching to Read Romanically.* The fundamental principle of the phonetic system is: *complicated phenomena can only be understood through a series of approximations*. Thus the planetary motions must first be viewed as circular, then as elliptical, and lastly, as perturbed. As a practical consequence of this principle, *each approximation must, to be of value, be regarded as complete, for the time*, and the subsequent approximations must be referred to it, so that the differences may be appreciated as residual phenomena. To apply this to reading. We have the facts that our orthography is intentionally, as it was originally, phonetic, and that the deviations are due to a great variety of historical and local circumstances, which, like the meteorological changes, we may

despair of ever thoroughly grasping, although we may obtain certain empirical laws which, as in the weather, are sufficient guides to practice.

Hence the first approximation requires a strictly phonetic alphabet,—which necessitates, first, the dismissal of mere reduplicate letters, as *c, q, x*, which are expressible by *k, h, ks, gzs*; and second, the addition of letters for unrepresented sounds. As to the forms of the letters, the same principle of approximation requires that the new letters, *without being combinations*, should yet somewhat resemble the combinations usually found in their place. With this alphabet, then, children should be taught to read, *as if no other alphabet existed*. One of the greatest drawbacks to any method of teaching by the ordinary alphabet first, is the necessity which exists of introducing children to anomalies and irregularities from the very first, as in *to go on*, where *o* has three sounds.

When they can read fluently in phonetic print, they resemble the young astronomer who thoroughly understands the solar system on the hypothesis of circular motion. The next approximation leads him to form roughly *for him* the laws of the differences between the actual romanian and the hypothetical phonetic forms of words, by presenting to him, in romanian print, a series of pages with which he is already familiar in the phonetic form, so that from his previous knowledge of the words, and his present knowledge of the first approximate meanings of all the letters they contain, he may elicit the second approximation. He is thus made a discoverer, an active cooperator with the teacher, not a passive recipient of instruction. After he has advanced, the teacher leads him to a more definite conception of these rough laws, which are then tabulated for his use.

The third approximation occupies his whole life, and few or none are those who *thoroughly* master it. But a very near approximation, and one sufficient for most purposes of life, is attainable at school—first, by reading many romanian books,—second, by writing many romanian pages. The second is useless without the first, the first cannot be secured without the second. The two together fix romanian *spelling* in the mind as distinct from phonetic, with which it is, therefore, never confused.

47. Principles of Teaching Phonetic Reading. The above contains the general principle of the phonetic system, and shows its action in removing the objection arising from the existence of a non-phonetic orthography, by becoming itself the easiest and most scientific road to its acquirement. We have now to consider how the first approximation, or phonetic spelling itself, is to be inculcated in such a way as to give all children a good knowledge of what is meant by a phonetic analysis of language, and a familiarity with its ap-

plication by actual practice, not forgetting to seize upon all the incidental educational advantages which it affords.

The principles for teaching the first approximation, or phonetic reading simply, are, first, *all knowledge is acquired by observing phenomena, reducing the relations observed to a law, and verifying this law by deduction*. Applied to teaching reading, this shows us that we should first familiarize the child with the sounds, next fix them in his mind by a symbol, and lastly familiarize him with the symbol by use, thus establishing the reality of the relations of sounds first observed. The second principle is, *the mind can only thoroughly appropriate one phenomenon at once*. Hence we should not attempt to familiarize a pupil with the nature of a sound, the form of a symbol, and the connection of the two, at one and the same time, or teach the connection of two sounds, simultaneously with their first presentation.

These two principles are not only applicable to teaching phonetic reading, but to all instruction whatever. Thus we teach the idea, then the word, and then accustom the pupil to use the word. The contrary course leads to inevitable confusion. By this process, therefore, we train a child's mind logically from the first *without*, of course, letting him be taught the *secret* in so many words—and lead him imperceptibly to appreciate *order*, and to exercise *judgment*, to observe and reflect, to analyze and compound.

Hence we first teach children isolated sounds *without the letters*. They are familiar with *connected* sounds, which we lead them by echoes and interjections (as laughs,) and hums, and hisses, and buzzes, to separate. We also lead them to connect the isolated sounds. We make them feel that a drawl is only a tardy connection, the first step to isolation.

We next lead them to observe the forms of letters. As sounds are best taught *without letters*, so letters are best taught *without sounds*, or names. The shape of a letter is its name. If a packet of letters be thrown down and the teacher expose one, the children will match it by eye not only more readily than by knowing its name, but with more advantage to their power of observing form. By this expedient, too, the study of sounds and of forms may form the subjects of different lessons on the same day with young children. The teacher will of course take care that the forms first learned are those which will be first required in reading.

It is not necessary, nor advisable, that *all* the sounds and *all* the forms should be known before the child is taught to connect them. On the contrary, after some dozen are known the interest of the pupil will be increased by the connection between those already learned being explained. In

this way three lessons daily can be given, each *very* brief, (ten or fifteen minutes,) and each separated by a much longer interval, one on sounds, one on forms, and one on connection.

The connection once established between separate sounds and separate letters, united sounds are shown to be symbolized by united letters, and as soon as the child readily associates his sounds with his letters, and remembers to keep on his voice when the letters are connected, and pause only when they are disconnected, *he can read phonetically*, and, as in all other acts, only requires practice to make him perfect.

The phonetic method of teaching by a series of approximations, of which the first consists of a *completed* phonetic alphabet, *was, so far as we know, never used or proposed, till it was discovered in 1847-8-9*, by those benevolent gentlemen who endeavored to teach poor persons to read phonetically only, rather than not at all, and so gradual has been the experimental progress made, that seven years have been required to systematize the method and refer it to its elementary principles. It can now lay claim to the title of system, as a thoroughly co-ordinated inductive method, sound in theory and successful in practice.

48. *Dr. Stone's Experimental Proof of the Value of the Phonetic System.* The amount of its success has indeed been very extraordinary, and has been especially exhibited in America by the exertions of Dr. James W. Stone, a physician of Boston, and member of the legislature of Massachusetts, who, from purely philanthropic motives, has devoted much care, time, and money to the introduction of the reading reform in America. In order to *exhibit* the practical value of the phonetic system he instituted an experiment of which he published the following account in 1851:

"Fifty children, of from two and a half to seven years of age, have been taught to read at a private phonetic school, by Miss Emma L. Lothrop, in the Warren-street chapel, where persons interested are invited to attend on any week-day from ten to eleven o'clock only. The first class is composed of twelve children, who commenced the study of the phonetic system in September last, [about six or eight months past,] since which time they have been absent from school on the average three months each, in consequence of sickness. When in school they have received about two hours' instruction daily in reading and the analysis of words; the remainder of the time having been devoted to other exercises, and to the rest of the school. In September two or three of the children knew their letters, and could spell out a few easy words; but the majority, and those who are now the best scholars, could not then read at all, and did not even know their let-

ters. *Three of the children, from three and a half to four and a half years of age, who can now read fluently, are German children, and could not utter a word of English when our school commenced.* Their parents cannot even now speak English. They therefore still converse with the children in German, and can necessarily give them no instruction in their studies; nor can the children generally obtain instruction at home, as all the parents are ignorant of phonetics.

"The charge is constantly made by those who hear the children, that their astonishing proficiency is either owing to their own precociousness or to the extraordinary ability of the teacher. But the children have not been selected. That some of them are remarkably bright is too palpable to be denied. On the other hand, those who have made themselves thoroughly acquainted with the school, cannot fail to perceive that several of the pupils are below the average standard in natural powers. Those powers have, however, been wonderfully elevated and strengthened by the certainty of the system which they have learned. It is also clear, that the school is blessed with a good teacher; but we have yet to learn that she claims for herself, or that her friends ever claimed for her, 'extraordinary ability.' We are confident that the results which these pupils have exhibited, can be obtained with any children of average powers by any teacher who will devote herself to her duty with the enthusiasm, the faithfulness, and the ambition, which Miss Lothrop has evinced, and which are a necessary consequence of a love of phonetic science."

Dr. Stone excited much public attention by publicly exhibiting the extraordinary proficiency acquired by the children in his experimental school, and challenging any 'common school' to produce children of the same age and school attendance who could surpass them. Rewards to the amount of \$500 were offered on some occasions, and children certified to be the best scholars of their age in various schools attended, but the phonetic children invariably bore off the palm. The judges selected were often some of the best known men in the state, as Fitzpatrick, the bishop of all the New England Catholics; Sumner, the senator; Sherwin, president of the Massachusetts' State Teacher's Association; Prescott, the historian, and so on. But passing over these remarkable exhibitions, it may be enough to insert the opinion expressed by Hon. Horace Mann, who was for twelve years secretary of the Board of Education in Massachusetts, and whose reports have made that Board famous throughout Europe.

West Newton, Mass., 3d July, 1851.

To DR. J. W. STONE.—Dear Sir: Having witnessed the exercises of a class of nine children under your care in reading phonography, (or pho-

netic shorthand,) and phonotypy, (or phonetic print,) it gives me pleasure to assure you of the delight which their performances gave me. I think the nine Muses were never listened to by a more gratified audience. . . . The children you exhibited had certainly made most wonderful proficiency, and were, in several of the essentials of good enunciation and reading, *years* in advance of most children who had been taught in the old way.

Yours truly,

HORACE MANN."

Not resting satisfied with the results of such exhibitions, and the opinions of private individuals, Dr. Stone resolved to bring the question before the Legislature of his state. Two legislative committees were appointed to examine and report. The first report is dated 15th May, 1851, and the second, 13th April, 1852. Both are highly favorable. The following are the commencing and concluding paragraphs of the able report of the second committee. The committee sat in consequence of the petition of Dr. Stone, Mr. Otis Clapp, Mr. C. F. Barnard, and others, trustees of the Boston Phonetic School, and these are the "petitioners" alluded to.

"On the afternoon of 3d March, 1852, the petitioners presented for examination by the committee, eight children, of from four to seven years of age. The children were the same as those who appeared, 12th May, 1851, before the Joint Legislative Committee on Education, who gave a very favorable report, and stated that 'the advantages to be derived from the introduction of the phonetic system into our common school instruction will be very important.' Since that time, the committee are informed that the system has been introduced with considerable success into about twelve of the public schools of the state; and that the universal testimony of the teachers is, that these great desiderata are, by means of the new system, secured, namely, that *the children evince a much greater attachment to their books, and learn with comparative ease.*

"The children exhibited to the committee have received instruction from but one lady for a little more than a year, the most of the time in a school of fifty children, in the Warren-street chapel, Boston. They read not only in phonotypy, or the printed phonetic alphabet, and in phonography, or the written shorthand, but also in romanian or common print, from difficult passages in newspapers and various books selected by the committee—many of which could never have been before seen by the children,—in a style, which, for the enunciation of the syllables, the pronunciation of the words, and the intonation of the sentences, the committee have rarely heard equalled by adults, and *never* by children of their age. In the analy-

sis of the sounds of the English language they are unrivalled."

The report, after explaining the construction of the phonetic alphabet, and pointing out the causes of the difficulty found to exist in learning romanian reading, proceeds thus:

"The Committee take it for granted that the English language, thus difficult of attainment, must be taught to each child and foreigner who becomes conversant with the structure of the language. And the problem to be solved is, What is the shortest method of accomplishing this laborious task? We find that the same law maintains supremacy in literature which governs in mechanics, in philosophy and the arts. The rule is so plain and universal that it needs no examples. The more gradual we make the ascent, either to information or position, the more rapid and sure the acquisition of both. *The examples the committee have seen, have proved that by means of the phonetic alphabet, the child or ignorant adult has been enabled to read the common print in a much briefer space of time than is usual. Evidence to this effect was presented to the committee from long-experienced teachers; and one cause of it is, that the phonetic print so strongly resembles the common print, that the great majority of the words of the former can be read without error by a person who has never previously seen it, but is able to read fluently from ordinary print.*

There is another point worthy of consideration. The Committee on Education, in their report in 1851, enumerated the benefits likely to result from the introduction of the phonetic system into public school instruction. Among them was one somewhat prophetic in its character, and which has since become most wonderfully fulfilled. The committee said, 'that by directing attention to the different methods of representing sound, the pupils will, in the end, become better *orthographists* than by the present mode.' At that time, no children taught by the phonetic method had ever even commenced to spell. Now, however, children who, on the 1st of July last, had never learned to spell a single syllable, were examined in the spelling of some of the most difficult words in the language, and exhibited a proficiency in that primary branch of a practical education, which the committee have never seen equalled even by children somewhat older than these, and who have had advantages of years of practice. The testimony before the committee of several members of the Governor's Council, as well as of the Senate and House of Representatives, and of other influential friends of education, coincided with this view. At the same time, as the committee have been credibly informed, the children have had in their school more studies than are usual in the primary schools of the city, and have rapidly advanced in their other studies.

"Impressed with the importance of the *phonetic system*, which, if primarily learned, according to the testimony presented, *would save two years of time* to each of the two hundred thousand children in the state, the committee would recommend to school committees and teachers the introduction of the *phonetic system of instruction into all the primary schools of the state, for the purpose of teaching the reading and spelling of the common orthography*, with an enunciation which can rarely be secured by the usual method, and with a saving of time and labor to both teachers and pupils, which will enable the latter to advance in physical and moral education alone till they are six years of age, without any permanent loss in the information they will ultimately obtain. The committee therefore deem the subject of sufficient importance to be worthy of the attention of school committees and of those who have charge of common school instruction."

In consequence of this highly favorable and luminous report, the Senate of Massachusetts, after a discussion, unanimously passed the following resolution:

"That the phonetic system of teaching the reading and spelling of the common orthography is worthy of the attention of those who have the charge of common school instruction, and that the town or district school committees who may see fit to test it, are requested to furnish such reports concerning it in their returns to the secretary of the Board of Education as they deem best."

In addition to the above American reports in favor of the reading reform, the following have been published: Reports by a committee of the American Academy of Arts and Sciences; a committee of the American Institute of Instruction; a committee of the American Association of the Friends of Education; a committee of the Ohio State Teacher's Association; a sub-committee of the Cincinnati School Committee; the committee on Education of the Michigan Legislature; a committee of the Massachusetts State Teachers' Association; a sub-committee of the Boston Primary School Committee, and others. It is believed that no committee was ever appointed to investigate its claims but what has reported favorably. The number of schools into which it has been since introduced, and the number of favorable notices which it has received in America, are very great.

49. *Three Testing Experiments on the Comparative Merits of the Phonetic and Romanic Systems.* Of all experiments, however, the most satisfactory and best are those made by teachers for their own satisfaction upon their own children, for the sake of contrasting the phonetic with the ordinary systems of teaching to read which they had previously employed. Three such

experiments of a most conclusive and satisfactory character, two in England and one in America, may here be mentioned.

I. At Mr. Williams's Secular School at Edinburgh, in September 1850, there were two classes of children, one between four and five, the other between five and six years of age; the first was just beginning to read, the second had learned reading for a year. In July, 1851, both classes were examined, when it was found that the younger children, who had learned less than a year, read as well as or better than the elder, who had learned two years. Now, there was no particular difference in the intellect of the children, who were not selected for the purpose of experiment, but taken as they happened to come to the school. The two classes were taught side by side, day by day, by the same teachers—pupil teachers and monitors, chiefly the latter. The elder class had had occasional assistance from parents out of school, the younger had none. The younger were taught for rather a shorter time daily than the elder, and had not the advantages of the simultaneous reading lessons which the older class enjoyed. The older class was not dull; it advanced fairly, and made the average progress. But, *the elder class was taught to read in the common way, the younger by the phonetic system.* The younger, therefore, although they began school at the same age as the other, had gained a year upon them in one year; at six they were as advanced as the others at seven. The phonetic system consequently was adopted at the school, and was used to the perfect satisfaction of the teacher till the close of the school in 1854 in consequence of Mr. Williams receiving a higher appointment.

II. Miss E. Baxter, teacher at a common school in South Boston, wishing to make trial of the phonetic system, and not having permission from the school committee during school hours, divided a class of sixteen young children, between four and five years old, into two parts as equal as possible in age, ability, and number. "A portion of them," to quote from her official report in April, 1852, "eight in number, received the usual amount of instruction in the common method in school. The remainder, when both pupils and teacher were exhausted by the labor of the day, after each school session, were taught for *twenty minutes* by means of the phonetic method, but received no instruction during school hours. What has been the result? From the sixth class, those taught *romanically*, (or in the usual way,) have advanced into the fifth as rapidly as children in a large school usually do in the same space of time, (eight months.) They can read easy words by first spelling them aloud, perhaps pronouncing one word in ten without a previous spelling; can enunciate passably, and spell a few short words. But from that same sixth class,

the eight taught phonetically have uniformly advanced, until they have reached, three the *second*, and five the *third* class, reading fluently in *both* prints, from much more difficult books than those who were taught romaniacally; spelling so much better that there is no comparison between them; enunciating distinctly, and also analyzing, or separating the compound sound of a word into its constituent simple sounds,) in a superior manner. The advantages of this system are, a great gain in time, fluent reading, accurate spelling, analysis of sounds, correct enunciation, cheerfulness, and love for study. And with the time thus saved, how much moral instruction may be given to the children?"

III. In the summer of 1851 the Society of Arts in London opened an educational exhibition in St. Martin's Hall, at which the Reading Reform Association exhibited its books, and a discussion took place upon the merits of the phonetic system of teaching to read as compared with other systems. At its termination an offer was made by Mr. Reynolds, the honorary secretary of the excellent Home and Colonial School Society, of London,—a society which sends out 200 trained teachers annually and supports training schools containing 600 children—to make trial of the system in their schools. An experiment was accordingly commenced, in which two classes of children, both unable to read, were tried simultaneously, the one by the very improved system then in use at that establishment, and the other by the phonetic system. The latter class was necessarily subject to several drawbacks from the romaniac arrangements of the school, and from the teacher having herself to learn the system as she proceeded. But the result of a trial begun at the end of September 1851 and concluded in the beginning of June, 1853, with several unforeseen interruptions, has been that the phonetic class read romaniacally so much better than the rival romaniac class that further experiments on a much larger scale are to be instituted forthwith, and the utmost satisfaction is expressed by the excellent secretary with the progress of the children.

50. These Experiments Prove that the Only Real Objections to a Spelling Reform must Ultimately Yield. These experiments, which are only a very few out of an immense number which have been tried, have been selected as offering every requisite for testing the system, and they establish the fact beyond all doubt, that the phonetic system is the best guide to the romaniac which has yet been discovered, while as a mere educational instrument it in many other respects presents advantages of the highest character, especially in its moral and logical effects upon the children. It is thus shown, then, that the existence of a non-phonetic orthography is so far from being an obstacle to the introduction of a phonetic spel-

ling for partial school use, that it is a main reason for such employment of a phonetic alphabet.

This very introduction of phonetics will, however, give that general phonetic knowledge which is indispensable to the subsequent advent of a spelling reform. As a little child who had made the transition from the phonetic to the romaniac spelling with great ease, lately observed, "I wonder why people print romaniacs when phonetics have been found out." This surprise, so *naturally* expressed, will be felt by all the children taught on this plan, and will ripen in their ripening minds into a determination not to use romaniac spelling at all. And thus a spelling reform becomes inevitable.

But while still in the transition state, and even afterwards when desirous of reading romaniac books, it will be necessary to have a work which contains the transliteration of every word in our language from romaniac into phonetic spelling, in order that the true sounds of the romaniac may be understood, while the significations should be printed phonetically to be useful to the mere phonetic reader. Such a work is the following, which marks the completion of the transitional works. With this book any one who has acquired phonetic reading, which he may do in a few weeks and from a very middling teacher,—any ignorant adult to whom learning to read on the old plan would be despairing, may teach himself to read any romaniac book, and may acquire the pronunciation and meaning of every romaniac word. This book marks the point where the two roads branch off. It points out the safest path to the romaniac cliffs, while it shows the broad and easy road which leads—not to destruction—but to the smiling plains of the new orthography.

51. Conclusion. Thus, then, has it become possible to institute a spelling reform with not only a reasonable hope, but an undoubted certainty of final success. In other cases enthusiasts in their anxiety to benefit the future have forgotten the past. The days of iconoclasm are gone by. We recognize, admire, and are thankful for the manifold blessings which we have derived from the old spelling, but these do not blind us to its defects, or prevent us proposing a reform. Our motto is *onward*—*onward* to a known goal. We must found the future on the past; the present is but a bridge between two eternities. This is an inviolable law, and all success must be gained by obeying it. Our past is romaniac spelling, our future phonetic; the present, the bridge which conveys us safely from one to the other, is the reading reform, or the phonetic system of teaching romaniac reading. This is a feature which no other plan for changing our spelling ever possessed. No other plan has found so many friends, so many adherents, so many testers, so

many judges, so many critics, so many approvers: no other plan has lived so long a life, has been cultivated so widely, both in England and America, has shown so many signs of health and future triumph, as the present.

With this book, then, we can lay it conscientiously before the American world as morally, logically, and practically desirable: as a blessing to children and teachers, as an intellectual improvement to the mass, as a practical commercial possibility. More than all these, the spelling reform as we have pictured it, as we have traced it step by step from its origin through its theory and practice, will, even in its transitional state of a reading reform, and far more in its future developed condi-

tion, become the source of immense social and political gain, in the great and general improvement which it must occasion in the education of the people—especially of the people of England. To read and write will indeed appear as Shakspeare's clown had it, to "come by nature," and the attention of educators will be withdrawn from the mere tools of knowledge to the weightier matters of intellectual and moral improvement. But here we forbear to speculate. Our task is done, and with these words we lay the complete spelling reform before the reader. *Esto perpetua.*

SYLLABICATION AND PRONUNCIATION.

SYLLABICATION.—No difficulty is experienced in dividing words into syllables where there is no transitional effect of one letter on another, as in *ad-vin-s*, *kon-tin*, *br-môn*. But in the word *kom-ô-ni-kut*, the *m* has a final effect on the *o*, and an initial effect on the *ô*. In dividing such words into syllables, we must either double the consonant, and thus preserve both effects of the medial letter, or sacrifice one of the effects. The best plan seems to be to sacrifice the initial effect of the medial consonant. If the final effect is retained by joining the medial letter to the first vowel, the initial effect on the following vowel will be heard in the proper consecutive pronunciation of the word, though it may be sacrificed in dividing the word into syllables. When the vowel preceding the medial letter is a stopped one, the consonant should be joined with it, to distinguish it from a brief or unaccented long vowel. The rule applicable to most cases may be stated thus:

1. When only one consonant is found between two vowels, the consonant is to be taken with the first vowel when it has a final effect on it, and with the second vowel in other cases.*

As a general rule, the consonant has this final effect on the preceding vowel when that vowel is long or stopped; thus, *del-er*, *br-môn*, *ô-sô*; and not so when the vowel is brief; as, *br-môn*, *de-lit*, *a-sô*.

The only exception to this rule made in this work is where words begin with *a*; as, *a-dikt*, *a-fîles*, *a-lôr*, the final effect is sacrificed, because the initial effect on the following vowel is made prominent by accent, and its final effect on the preceding vowel is less obvious than on any other vowel in that position.

2. When several consonants come between two vowels, all those that have a final effect on the preceding vowel may be, and at least one of them must be, taken with it, while those which are left to be taken with the second vowel must be in all cases such as do or can exert an initial effect upon it.*

Thus, we divide *ren-diy* or *ren-dip*, *ep-zet* or *ep-zet*, in either of which a double division is possible. No such division is possible in *priest-kraft*, because it cannot be pronounced correctly when divided differently. When there is a genuine double consonant or vowel in a word, the division of the syllable always falls between the two letters of the same name; as, *sôl-les*, *un-nôn*, *un-nât-yu-ral*, *ô-ô-lit*.

UNACCENTED VOWELS.—When the long vowels are unaccented, they are somewhat shortened, as in *de-lit*, *re-gân*, *prj-maj*, *prê-as*, *mo-nô-pô-li*.

LONG U.—Words and syllables commencing with long *u* generally take *y* before it in phonetic spelling; as, *yû-yon*, *ed-yû-kâ-fon*. But when the *u* is preceded by a continuant consonant, the *y* is omitted; as, *ilûmin*, *inûmerabl*, *imûtabl*, *ifû*, *plêzûr*, *efûgon*. These exceptions owe their origin to the peculiar character of the continuants, the effect of which supersedes the use of *y*. When long *u* or *eu* is preceded by *r* in the same syllable, it is represented by *o*; as, *rad*, *brat*.

The *o* in *not* is employed in the terminations *on*, *fon*, and *zon*, because that is the pronunciation adopted by our best elocutionists. The use of short *u* in such syllables encourages a careless utterance.

NASAL VOWELS.—The French *ori-nasal* vowels represented by *în*, *im*, *en*, *em*, *an*, *on*, *un*, and other literal combinations, are pronounced through the nose and mouth at the same time, and are simple vowels. The sign *ñ* is used to indicate the nasal power of the preceding vowel.

RULES OF ACCENT.—1. Words of two syllables are accented on the first; as, *led-er*, *dû-ti*.

2. Words of three or more syllables are accented on the third from the end; as, *in-ter-est*, *dan-ger-ous*; Unless the last syllable but one contain a long vowel or diphthong—as, *re-man-d-r*, *de-lit-fu*; or end with *f* or *z* followed by a syllable commencing with a vowel—as, *re-mif-on*, *de-si-z-on*; or the last syllable begin with *f*, *z*, or *y*—as, *kon-jug-k-fon*, *in-dent-yur*,—in which cases the accent falls on the last syllable but one.

Exceptions to these rules are marked with the sign ' placed over the vowel to be accented; as, *a-lâ*, *de-lit*; *re-liz-on*, *re-pré-zent*; *hâr-mo-ni*; *pûb-lif-iz*.
